Position determination
Jut-out control | Height measurement | Profile detection | Sag control

Object presence
Access control | Reject control | Edge control

Application at toll booths and on industrial doors
Vehicle classification | Vehicle separation | Industrial doors

Pick-to-light
Operator guidance | Error-free commissioning

Light grid frame
Volume measurement | Operator guidance | Reject control

We offer off-the-shelf and tailor-made solutions to fit your exact needs.

Sensor Intelligence is our promise

SICK sensor solutions for industrial automation are the result of exceptional dedication and experience. From development all the way to service: The people at SICK are committed to investing all their expertise in providing with the very best sensors and system solutions possible.

A company with a culture of success

Approximately 5,000 people are on staff, with products and services available to help SICK sensor technology users increase their productivity and reduce their costs. Founded in 1946 and headquartered in Waldkirch, Germany, SICK is a global sensor specialist with more than 50 subsidiaries and representations worldwide. Our exemplary corporate culture fosters an optimum work-life balance, thus attracting the best employees from all over the world. SICK is one of the best employers – we have been among the winners of the prestigious German “Great Place to Work” award for many years in succession.

A

Innovation for the leading edge

SICK sensor systems simplify and optimize processes and allow for sustainable production. SICK operates thirteen research and development centers all over the world. Co-designed with customers and universities, our innovative sensor products and solutions are made to give a decisive edge. With an impressive track record of innovation, we take the key parameters of modern production to new levels: reliable process control, safety of people and environmental protection.

A corporate culture for sustainable excellence

SICK is backed by a holistic, homogeneous corporate culture. We are an independent company. And our sensor technology is open to all system environments. The power of innovation has made SICK one of the technology and market leader – sensor technology that is successful in the long term.

A

Sensor Intelligence for all requirements

SICK is a renowned expert in many industries, and is entirely familiar with the critical challenges they face. While speed, accuracy and availability take center stage in all industries, technical implementations vary greatly. SICK puts its vast experience to use to provide with precisely the solution you need.

For applications worldwide

Hundreds of thousands of installations and applications go to prove that SICK knows the different industries and their processes inside out. This tradition of uncompromising expertise is ongoing: As we move into the future, we will continue to design, implement and optimize customized solutions in our application centers in Europe, Asia and North America. You can count on SICK as a reliable supplier and development partner.

A

For your specific industry

With a track record of proven expertise in a great variety of industries, SICK has taken quality and productivity to new heights. The automotive, pharmaceutical, electronics and solar industries are just a few examples of sectors that benefit from our know-how. In addition to increasing speed and improving traceability in warehouses and distribution centers, SICK solutions provide accident protection for automated guided vehicles. SICK system solutions for analysis and flow measurement of gases and liquids enable environmental protection and sustainability in, for example, energy production, cement production or waste incineration plants.

For performance across the board

SICK provides the right technology to respond to the tasks involved in industrial automation: measuring, detecting, monitoring and controlling, protecting, networking and integrating, identifying, positioning. Our development and industry experts continually create groundbreaking innovation to solve these tasks.

A

For safety and productivity: SICK LifeTime Services

SICK LifeTime Services is a comprehensive set of high-quality services provided to support the entire life cycle of products and applications from system design all the way to upgrades. These services increase the safety of people, boost the productivity of machines and serve as the basis for our customers' sustainable business success.

Benefit from an array of services

Each of our products and solutions is accompanied by a comprehensive range of services tuned precisely to the requirements of the product or solution – along its entire life cycle. Backed by extensive industry know-how and more than sixty years of experience, LifeTime Services stand for maximum availability and an exceptional service life of our products and solutions.

B

For demanding requirements

Advanced automation light grids are ideal for more complex applications. They come in several different beam separation options, a range of detection heights and output configurations. These light grids can be used for material handling on conveyors, automated storage and retrieval system applications, order fulfilment, and more. For example, in pallet verification applications, maximum height and pallet overhang can be measured. This data can be forwarded to the PLC via bus systems.

Your benefits

- Sensors with high quality and performance for customer-oriented solutions
- Highest immunity to ambient light, eliminates false trips
- Flexible programming for customized solutions, saves costs
- Easy-to-see status information helps avoid interrupting operation, saves costs
- Different beam separation options, detection heights and output configurations ensure a reliable solution

8014230/2011-09-01

B

Advanced automation light grids

Modular multi talents – personalize your own light grid

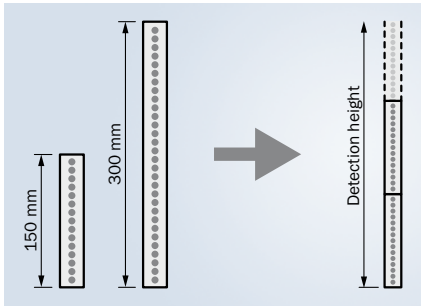
B

Whether pre-configured or programmed by the customer, the range of possibilities is endless with advanced automation light grids. On request, SICK will fully customize your light grid – both hardware and software.

Modular construction – enables you to decide for yourself!

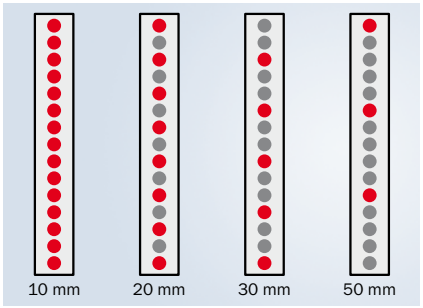
Advanced automation light grids are configured using a modular design principle. Detection height, resolution and range can be chosen to meet your requirements.

Detection height
Minimum = 100 mm
Maximum = 3,140 mm



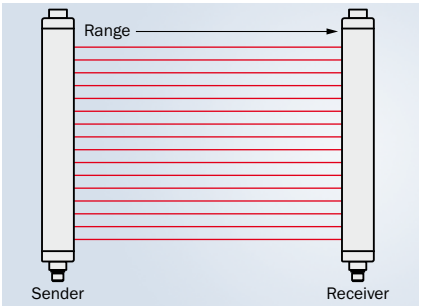
Simple interconnection of optics modules with lengths of 150 mm or 300 mm. Monitoring height determines how many modules to use.

Beam separation
Minimum = 10 mm
Maximum = 50 mm



Beam separation varies depending on how the optics modules are equipped with LEDs. The smaller the beam separation, the higher the resolution will be. There is also an MLG variant with a beam separation of 25 mm.

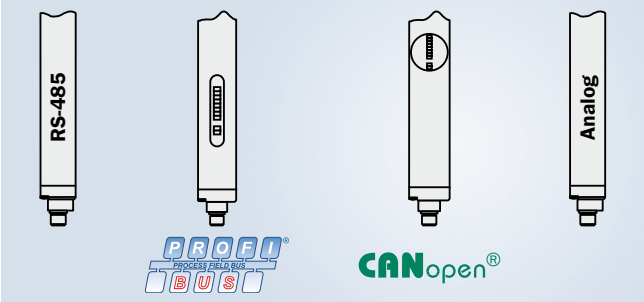
Range
Minimum = 0 m *)
Limiting scanning range = 12 m



A choice of ranges completes the modular hardware configuration.

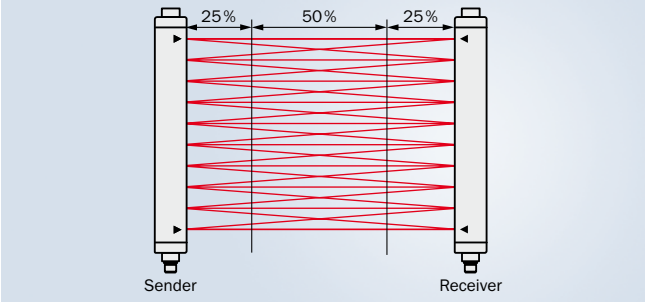
*) With parallel beam.

Interfaces/bus functionality



Interfaces integrated in each device mean there is no need for any additional hardware. Addressing of each bus-compatible MLG is via a separate address.

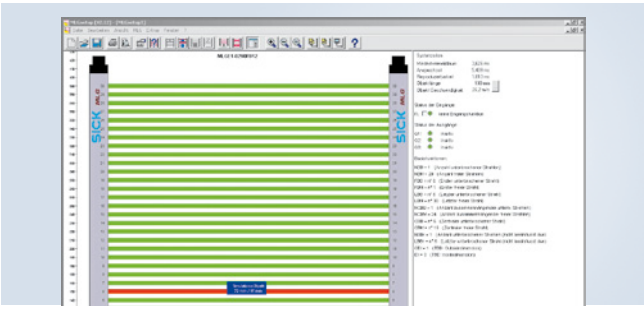
Cross beam function



Due to the cross beam function, the resolution of the light grids can be increased even further. The resolution in the central area between sender and receiver is twice as high. This enables even small objects to be reliably detected.

B

Basic software functions



MLG setup software comes with multitude of pre-programmed basic functions e.g., “Last Beam Blocked (LBB)” for measurement of heights.

Standard or programmable

The MLG Standard is used for **switching** applications, however, programmable variants are used for **measuring** applications.

XLG – anti-glare light grid with light protection factor

The XLG advanced automation light grid from SICK is outstanding for use in **outdoor areas**. It is one of the first **anti-glare light grids** on the market.
A special optic ensures each light beam arrives at the receiver and is detected.

Yet, that's not all:
As an optional accessory, SICK has developed a **protection housing**, which provides additional protection against dirt for the light grid.

B

MLG – Logistics

Modular light grids (**MLG**) are used in various logistics areas. Particularly in automatic warehousing systems, checking for projections with height measurement is essential. In mail distribution centers, they determine the position of parcels on the conveyor and transfer the data to a PLC via bus systems. With their integrated basic functions, they enable dynamic warehousing systems to optimize workflow and space.

MLG – Airports

MLG automation light grids are used at turnstiles in airports to ensure no unauthorized persons enter secure airport areas or exit the turnstiles in the wrong direction. They also make passing objects over the turnstiles virtually impossible.

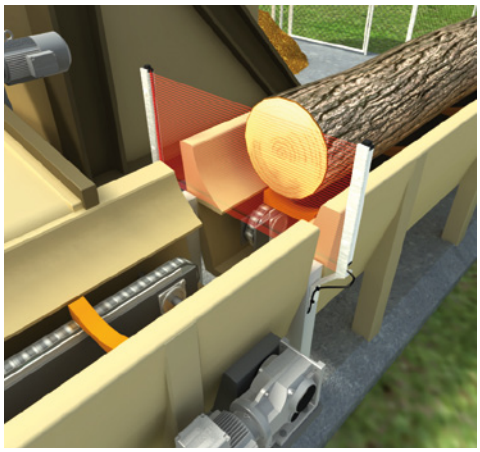
MLG – Warehousing

To attain optimal storage compression while enabling flexible warehousing strategies at the same time, it is essential that goods for automatic storage are checked for height and to ensure there is no overhang. That way they can be assigned to the correct storage space and ensure collision-free lift transportation. The **MLG** automation light grid combined with “tray overhang” software – specially developed by SICK – enable relevant object dimensions to be captured.

XLG – Wood

Log measurement
XLG advanced automation light grids are used to measure the length and diameter of logs. Using the acquired data, any large roots on the log are detected and the log is then fed via the bypass to a butt reducer.

Diameter detection
The **XLG** advanced automation light grid detects log diameter so that the log is centered in the bark stripper.



B

XLG – Traffic

Key tasks for toll systems are the fast separation of vehicles and their unique classification. The **XLG's** absolute immunity to infrared light and sunlight, the optional heated protective housing and its scratch- and weather-resistant front screen ensure a high level of reliability over long periods of time, even in the most adverse outdoor conditions.

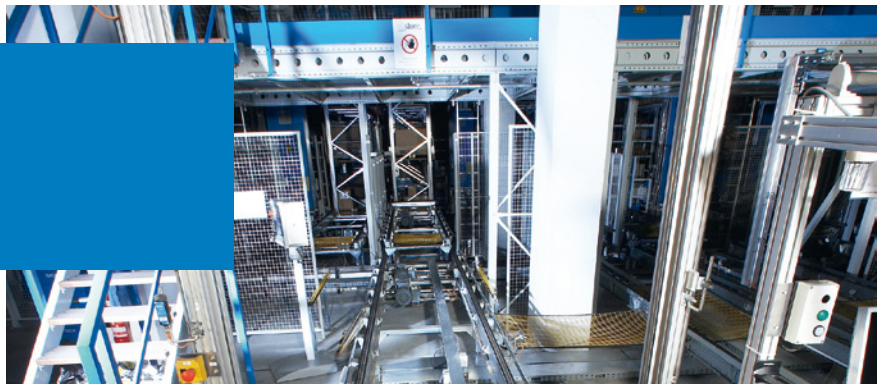
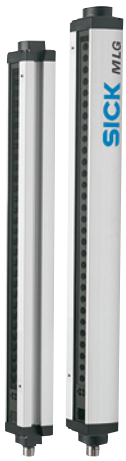
B

B

For switching applications





Product description

The MLG Standard offers a high level of switching flexibility in applications. The standard models perform like a typical through-beam photoelectric sensor and provide an output if any of the beams is interrupted. They offer fast response time and are highly modular. A range of different resolutions and detection heights are available. In addition, the MLG Standard automation light grid offers a wide spectrum of application options and excellent durability.

At a glance

- Up to 3 x PNP or NPN switching outputs
- Resolutions of 10 / 20 / 30 / 50 mm and customer-specific resolutions
- Working range up to 8.5 m
- Detection heights of over 3 m and up to 240 beams possible
- Short response time < 3 ms
- Automatic teach during power on

Your benefits

- Easy-to-see status information helps avoid interrupting operation, saves costs
- Different beam separation options, detection heights and output configurations ensure a reliable solution
- Integrated interfaces reduce cabling time and costs
- A fully modular system guarantees the optimal solution for the customer

Detailed technical data

Features

Technology	Sender/receiver
Task	Measurement light grid
Minimum detectable object (MDO)	Parallel beam: 15 mm ... 60 mm Cross beam: 10 mm ... 35 mm
Number of beams	3 ... 240
Configuration	No configuration

Performance

Maximum range [1]	7 m 12 m
Minimum range	Parallel beam: ≥ 0 mm Cross beam: 200 mm (10 mm beam separation) Cross beam: 360 mm (20 mm beam separation) Cross beam: 520 mm (30 mm beam separation) Cross beam: 840 mm (50 mm beam separation)
Response time [2]	Parallel beam: 1.5 ms ... 37 ms Cross beam: depending on type

[1] No reserve for environmental issues and deterioration of the diode.

[2] With resistive load.

Interfaces

Inputs [1]	1 x PNP 1 x NPN

[1] 1 test input for sender.

Mechanics/electronics

Wave length	IR, 880 nm
Supply voltage V_S	DC 18 V ... 30 V
Power consumption sender [1]	< 140 mA + 2 mA per beam
Power consumption receiver [1]	< 100 mA + 3 mA per beam
Ripple	< 5 V_{SS}
Output current $I_{max.}$	100 mA
Output load capacitive	100 nF
Output load inductive	1 H
Initialization time	1 s
Dimensions (W x H x D)	34 mm x 214 mm x 29 mm ... 34 mm x 3,335 mm x 29 mm
Housing material	Aluminum
Indication	LED, 7-segment display
Synchronization	Cable
Enclosure rating	IP 65
Circuit protection	U_V connections reverse-polarity protected Output Q short-circuit protected Interference suppression
Weight	0.73 kg ... 7.722 kg
Front screen	PMMA

[1] Without load with 24 V.

B

Ambient data

Protection class	III
EMC	EN 60947-5-2
Ambient temperature	Operation: –25 °C ... +55 °C Storage: –40 °C ... +70 °C
Ambient light safety [1]	Direct: 12,500 lx Indirect: 50,000 lx
Vibration resistance	5 g, 10 Hz ... 55 Hz (IEC 68-2-6)
Shock load	10 g / DIN EN 60068-2-29 / 16 ms

[1] Sunlight.

B

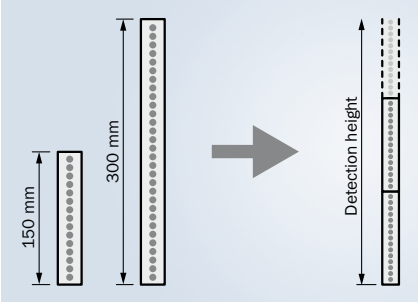
Special functions

Modular construction

The advanced automation light grids are using a modular design principle. Every optics module has 15 beams. If you want to calculate the detection height, you have to subtract the single beam separation of the overall height of the optics modules.

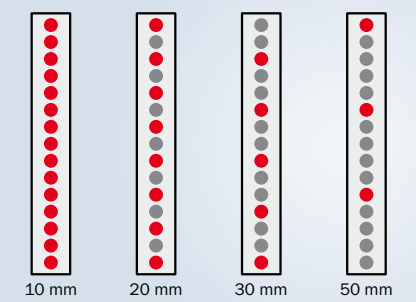
E.g. 3 x 150 mm = 450 mm (overall height)
450 mm – 10 mm (beam separation) = 440 mm (detection height)

Detection height
Minimum = 100 mm
Maximum = 3,140 mm



Simple interconnection of optics modules with lengths of 150 mm or 300 mm. Monitoring height determines how many modules to use.

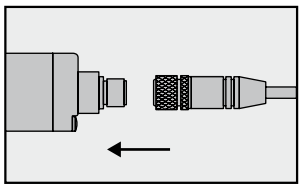
Beam separation
Minimum = 10 mm
Maximum = 50 mm



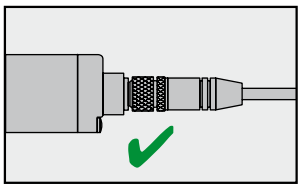
Beam separation varies depending on how the optics modules are equipped with LEDs. The smaller the beam separation, the higher the resolution will be. There is also an MLG variant with a beam separation of 25 mm.

Plug & Play

1. Plug in and tighten the ring of the connector



2. Device is ready for use



B

B

For customized solutions

Product description

The programmable version of the MLG automation light grid is ideal for measurement applications, such as variable height measurement or for classifying objects. The programmable models include easy-to-use software, which enables extreme flexibility. The software quickly and easily turns a standard sensor into a custom problem solver, reducing the number of sensors, PLCs and programming required.The MLG offers many different configuration options and interfaces. It provides a choice of different detection heights and beam separation. The MLG can be supplied pre-programmed by SICK. For optimum installation, the customer can choose between different mounting brackets.

At a glance

- Resolutions of 10 / 20 / 30 / 50 mm and customer-specific resolutions
- Working range up to 8.5 m
- Detection heights of over 3 m and up to 240 beams possible
- Short response time < 3 ms
- External teach-in for optimal sensitivity settings
- Easy-to-use setup software for customized application

Your benefits

- Intelligent evaluation software saves costs by quickly and easily turning a standard sensor into a custom problem solver, reducing the number of sensors, PLCs and programming required
- Easy-to-see status information helps avoid interrupting operation
- Different beam separation options, detection heights and output configurations ensure a reliable solution
- 6 discrete outputs for custom solutions
- Robust metal housing stands up to tough environments and reduces downtime

Detailed technical data

Features

Technology	Sender/receiver
Task	Measurement light grid
Minimum detectable object (MDO)	Parallel beam: 15 mm ... 60 mm
Number of beams	3 ... 240
Configuration	Configuration interface (measuring)

Performance

Maximum range [1]	7 m 12 m
Minimum range	Parallel beam: ≥ 0 mm
Response time [2]	Parallel beam: 1.5 ms ... 37 ms Cross beam: depending on type

[1] No reserve for environmental issues and deterioration of the diode.

[2] With resistive load.

Interfaces

Inputs	2 x PNP 2 x NPN

Mechanics/electronics

Wave length	IR, 880 nm
Supply voltage V_S	DC 18 V ... 30 V
Power consumption sender [1]	< 140 mA + 2 mA per beam
Power consumption receiver [1]	< 100 mA + 3 mA per beam
Ripple	< 5 V_{SS}
Output current $I_{max.}$	100 mA
Output load capacitive	100 nF
Output load inductive	1 H
Initialization time	1 s
Dimensions (W x H x D)	34 mm x 214 mm x 29 mm ... 34 mm x 3,335 mm x 29 mm
Housing material	Aluminum
Indication	LED, 7-segment display
Synchronization	Cable
Enclosure rating	IP 65
Circuit protection	V_S connections reverse-polarity protected Output Q short-circuit protected Interference suppression
Weight	0.73 kg ... 7.722 kg
Front screen	PMMA

[1] Without load with 24 V.

Additional information

Product description

The MLG PROFIBUS version is used for measurement applications and has an integrated PROFIBUS interface. It is ideal for applications, such as variable height measurement or for classifying objects. It includes easy-to-use software, which enables extreme flexibility. The software quickly and easily turns a standard sensor into a custom problem solver, reducing the number of sensors, PLCs and programming required. The MLG PROFIBUS offers many different configuration options and interfaces. It provides a choice of different detection heights and beam separation. It can be supplied pre-programmed by SICK. It has its own PROFIBUS User Organization (PNO) number and the corresponding GSD file that makes it possible for the PLC to interpret the data output of the sensor. For optimum installation, the customer can choose between different mounting brackets.

At a glance

- Integrated PROFIBUS interface
- Resolutions of 10 / 20 / 30 / 50 mm and customer-specific resolutions
- Working range up to 8.5 m
- Detection heights of over 3 m and up to 240 beams possible
- Short response time < 9 ms
- External teach-in for optimal sensitivity settings

Your benefits

- Integrated PROFIBUS User Organization (PNO) number and GSD file for easy connection to a PLC
- Low cabling requirement reduces installation costs
- Easy-to-see light grid status information via the bus system helps avoid interrupting operation
- Different beam separation options, detection heights and output configurations ensure a reliable solution

B

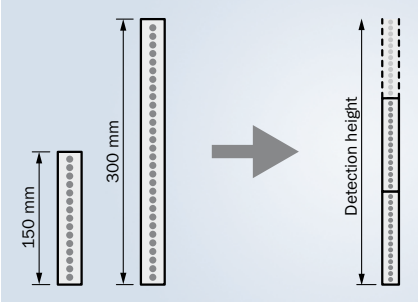
Special functions

Modular construction

The advanced automation light grids are using a modular design principle. Every optics module has 15 beams. If you want to calculate the detection height, you have to subtract the single beam separation of the overall height of the optics modules.

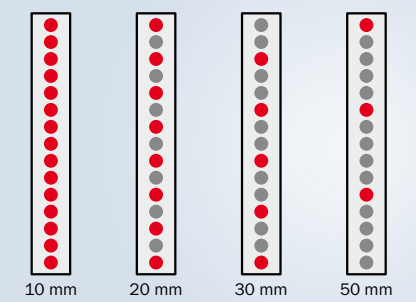
E.g. 3 x 150 mm = 450 mm (overall height)
450 mm – 10 mm (beam separation) = 440 mm (detection height)

Detection height
Minimum = 100 mm
Maximum = 3,140 mm



Simple interconnection of optics modules with lengths of 150 mm or 300 mm. Monitoring height determines how many modules to use.

Beam separation
Minimum = 10 mm
Maximum = 50 mm

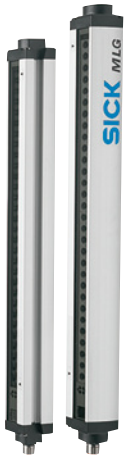


Beam separation varies depending on how the optics modules are equipped with LEDs. The smaller the beam separation, the higher the resolution will be. There is also an MLG variant with a beam separation of 25 mm.

B

B

For fast integration



Product description

The MLG CANopen has an integrated CANopen interface and is applied in measuring applications. Customers can choose the MLG for variable height measurement or for object classification. The MLG CANopen enables a lot of different configuration possibilities. The MLG is modular and can be ordered in different detection heights and beam separation options. The software is related to CANopen 2.0 CIA/DS-301 version 4.1. This software specification provides easy integration using EDS data sets. The customer can choose between different mounting options for optimal installation.

At a glance

- Integrated CANopen interface
- Resolutions of 10 / 20 / 30 / 50 mm and customer-specific resolutions
- Working range up to 8.5 m
- Detection heights of over 3 m and up to 240 beams possible
- Short response time of < 9 ms
- Teach algorithm for optimal sensitivity settings in difficult applications

Your benefits

- The CANopen software is 2.0 CIA/DS-301 for easy integration in the control system
- Low cabling requirement reduces installation costs
- East-to-see light grid status information via the bus system helps avoid interrupting operation
- Different beam separation options, detection heights and output configurations ensure a reliable solution
- Robust metal housing stands up to tough environments and reduces downtime

Detailed technical data

Features

Technology	Sender/receiver
Task	Measurement light grid
Minimum detectable object (MDO)	Parallel beam: 15 mm ... 60 mm
Number of beams	3 ... 240
Configuration	EDS file

Performance

Maximum range [1]	7 m 12 m
Minimum range	Parallel beam: ≥ 0 mm
Response time [2]	Parallel beam: 9 ms ... 57 ms Cross beam: depending on type

[1] No reserve for environmental issues and deterioration of the diode.

[2] With resistive load.

Interfaces

Inputs [1]	1 x PNP

[1] 1 x test input for sender.

Mechanics/electronics

Wave length	IR, 880 nm
Supply voltage V_S	DC 18 V ... 30 V
Power consumption sender [1]	< 140 mA + 2 mA per beam
Power consumption receiver [1]	< 100 mA + 3 mA per beam
Ripple	< 5 V_{SS}
Output current $I_{max.}$	100 mA
Output load capacitive	100 nF
Output load inductive	1 H
Initialization time	1 s
Dimensions (W x H x D)	34 mm x 214 mm x 29 mm ... 34 mm x 3,335 mm x 29 mm
Housing material	Aluminum
Indication	LED, 7-segment display
Synchronization	Cable
Enclosure rating	IP 65
Circuit protection	V_S connections reverse-polarity protected Output Q short-circuit protected Interference suppression
Weight	0.73 kg ... 7.722 kg
Front screen	PMMA

[1] Without load with load 24 V.

B

Ambient data

Protection class	III
EMC	EN 60947-5-2
Ambient temperature	Operation: –25 °C ... +55 °C Storage: –25 °C ... +70 °C
Ambient light safety [1]	Direct: 12,500 lx Indirect: 50,000 lx
Vibration resistance	5 g, 10 Hz ... 55 Hz (IEC 68-2-6)
Shock load	10 g / DIN EN 60068-2-29 / 16 ms

[1] Sunlight.

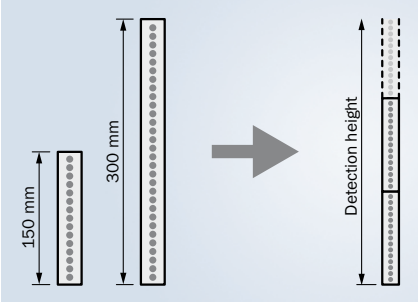
Special functions

Modular construction

The advanced automation light grids are using a modular design principle. Every optics module has 15 beams. If you want to calculate the detection height, you have to subtract the single beam separation of the overall height of the optics modules.

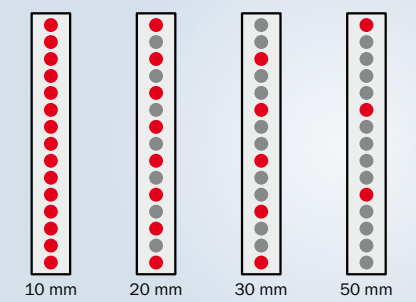
E.g. 3 x 150 mm = 450 mm (overall height)
450 mm – 10 mm (beam separation) = 440 mm (detection height)

Detection height
Minimum = 100 mm
Maximum = 3,140 mm



Simple interconnection of optics modules with lengths of 150 mm or 300 mm. Monitoring height determines how many modules to use.

Beam separation
Minimum = 10 mm
Maximum = 50 mm



Beam separation varies depending on how the optics modules are equipped with LEDs. The smaller the beam separation, the higher the resolution will be. There is also an MLG variant with a beam separation of 25 mm.

B

Easy measuring with analog outputs

B

Product description

The modular light grid MLG with analog output and internal software features can be used for intelligent height measurement and positioning. The MLG has two analog outputs: 4 to 20 mA or 0 to 10 V. Two analog outputs allow size and position measurement directly to an analog controller. A new teaching function (range setup) helps eliminate errors from reflective surfaces or semi-transparent objects.

At a glance

- Two analog outputs: voltage to current
- Resolutions of 10 / 20 / 30 / 50 mm and customer-specific resolutions
- Working range up to 8.5 m
- Detection heights of over 3 m and up to 240 beams possible
- Short response time of < 3 ms possible
- Teach algorithm for optimal sensitivity settings in difficult applications, such as measuring trans-lucent objects
- Easy-to-use setup software for customized applications with new features
- Software tools, such as height measurement, zoning, hole detection, and presence control make implementation of complex solutions achievable

Your benefits

- Intelligent evaluation software saves costs by quickly and easily turning a standard sensor into a custom problem solver, reducing the number of sensors, PLCs and programming required
- Easy-to-see status information helps avoid interrupting operation
- Different beam separation options, detection heights and output configurations ensure a reliable solution
- Integrated analog outputs reduce integration costs for measuring applications, because no additional software is necessary
- Discrete outputs for custom solutions without a PLC
- Tough metal housing stands up to harsh environments and reduces downtime

Detailed technical data

Features

Technology	Sender/receiver
Task	Measurement light grid
Minimum detectable object (MDO)	Parallel beam: 15 mm ... 60 mm
Number of beams	3 ... 240
Configuration	Configuration interface (measuring)

Performance

Maximum range [1]	7 m 12 m
Minimum range	Parallel beam: ≥ 0 mm
Response time [2]	Parallel beam: 1.5 ms ... 37 ms Cross beam: depending on type

[1] No reserve for environmental issues and deterioration of the diode.

[2] With resistive load.

Interfaces

Inputs	2 x PNP 2 x NPN

Mechanics/electronics

Wave length	IR, 880 nm
Supply voltage V_S	DC 18 V ... 30 V
Power consumption sender [1]	< 140 mA + 2 mA per beam
Power consumption receiver [1]	< 100 mA + 3 mA per beam
Ripple	< 5 V_{SS}
Output current $I_{max.}$	100 mA
Output load capacitive	100 nF
Output load inductive	1 H
Initialization time	1 s
Dimensions (W x H x D)	34 mm x 214 mm x 29 mm ... 34 mm x 3,335 mm x 29 mm
Housing material	Aluminum
Indication	LED, 7-segment display
Synchronization	Cable
Enclosure rating	IP 65
Circuit protection	V_S connections reverse-polarity protected Output Q short-circuit protected Interference suppression
Weight	0.73 kg ... 7.722 kg
Front screen	PMMA

[1] Without load with 24 V.

[2] Typical value.

B

Ambient data

Protection class	III
EMC	EN 60947-5-2
Ambient temperature	Operation: –25 °C ... +55 °C Storage: –40 °C ... +70 °C
Ambient light safety [1]	Direct: 12,500 lx Indirect: 50,000 lx
Vibration resistance	5 g, 10 Hz ... 55 Hz (IEC 68-2-6)
Shock load	10 g / DIN EN 60068-2-29 / 16 ms

[1] Sunlight.

For additional accessories including dimensional drawings, please see page E-2.

B

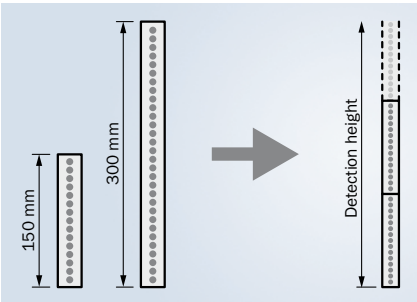
Special functions

Modular construction

The advanced automation light grids are using a modular design principle. Every optics module has 15 beams. If you want tc calculate the detection height, you have to subtract the single beam separation of the overall height of the optics modules.

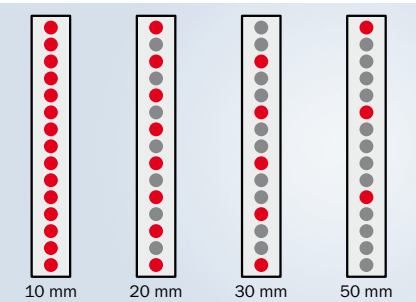
E.g. 3 x 150 mm = 450 mm (overall height)
450 mm – 10 mm (beam separation) = 440 mm (detection height)

Detection height
Minimum = 100 mm
Maximum = 3,140 mm



Simple interconnection of optics modules with lengths of 150 mm or 300 mm. Monitoring height determines how many modules to use.

Beam separation
Minimum = 10 mm
Maximum = 50 mm



Beam separation varies depending on how the optics modules are equipped with LEDs. The smaller the beam separation, the higher the resolution will be. There is also an MLG variant with a beam separation of 25 mm.

B

B

Reliable measurement even in sunlight

Product description

The programmable version of the XLG automation light grid offers reliability, speed and flexibility. It has additional features compared to the MLG. The XLG's high immunity to infrared light and sunlight, the optional heated protective housing, and the scratch- and weather-resistant front lens ensure a high level of reliability over long periods of time, even in the most adverse external conditions. Response times of only a few milliseconds and fast data output interfaces, such as RS-485, ensure it can operate in a wide range of outdoor applications.

At a glance

- Up to 6 x PNP or NPN switching outputs and two switching inputs
- Resolutions of 10 / 20 / 30 / 50 mm and customer-specific resolutions
- Working range up to 5 m
- Detection heights of over 3 m and up to 150 beams possible
- Short response time < 3 ms
- External teach-in for optimal sensitivity settings
- Highest immunity to sunlight
- Scratch-resistant front lens

Your benefits

- Highest immunity to sunlight for trouble-free operation
- Intelligent evaluation software saves costs
- Easy-to-see status information helps avoid interrupting operation
- Different beam separation options, detection heights and output configurations ensure a reliable solution

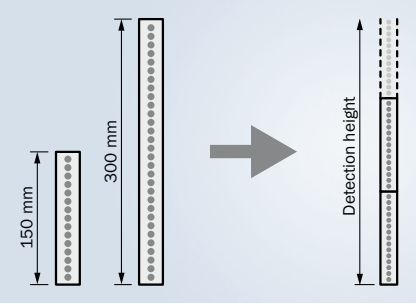
Special functions

Modular construction

The advanced automation light grids are using a modular design principle. Every optics module has 15 beams. If you want tc calculate the detection height, you have to subtract the single beam separation of the overall height of the optics modules.

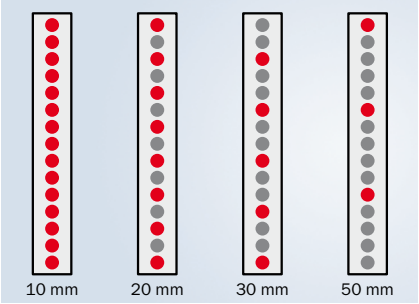
E.g. 3 x 150 mm = 450 mm (overall height)
450 mm – 10 mm (beam separation) = 440 mm (detection height)

Detection height
Minimum = 100 mm
Maximum = 3,140 mm



Simple interconnection of optics modules with lengths of 150 mm or 300 mm. Monitoring height determines how many modules to use.

Beam separation
Minimum = 10 mm
Maximum = 50 mm



Beam separation varies depending on how the optics modules are equipped with LEDs. The smaller the beam separation, the higher the resolution will be. There is also an MLG variant with a beam separation of 25 mm.

B

C

Easily detect, inspect or count with standard automation light grids

The standard automation light grids from SICK can be used in a number of solutions, such as detecting and counting of irregularly shaped objects, checking for presence and overhang of pallet loads. Light grids from SICK offer multiple ranges, heights, sizes, orientations, and resolutions. All processing is integrated in the light grids for fast setup with no external controller needed.

Your benefits

- A wide range of standard automation light grids for a variety of applications
- Insensitive to ambient light when exposed to direct sunlight, strobe lights, and highly reflective objects, eliminating false trips
- Retro-reflective light grids for one-sided detection reduce installation costs and can be used in compact spaces
- Reliable leading edge detection on high-speed conveyors provides accurate and repeatable triggering
- Industry standard connections for quick connection and commissioning, reducing overall setup costs
- Simple installation, easy setup, and application-specific housing designs make SICK standard automation light grids an easy addition to increase throughput and decrease waste
- Light grid with integrated reflective tape on the rear for easy mounting

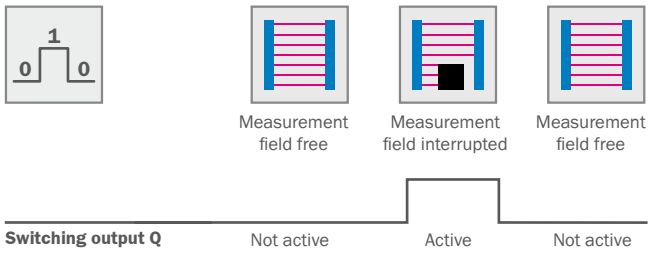
C

Standard automation light grids

Standard automation light grids – the switching solution suitable for your application

C

Standard automation light grids operate using the switching principle. They detect an object at any point in the measurement field and transfer the information “measurement field free” or “measurement field interrupted” to the switching output, Q. Unlike a measuring light grid, it can signal the presence of an object but not indicate its position or size.



An overview of your advantages

WLG

- Reliably detects small, irregular shaped objects
- Also available as a measuring variant

HLG

- Fastest detection, also for flat objects like letters
- Easy installation thanks to mounting groove on the housing

ELG

- High immunity to ambient light
- Working range up to 12 m allow reliable use at longer distances

PLG

- Integrated 360° job LED for error-free picking
- Easy mounting and alignment thanks to the use of a reflector

WLG – reject control

Typical applications for the **WLG12** reflection light grid include counting small parts, including metallic items. Retro-reflective light grids are mainly used in packaging, pressing and stamping technology.

Recommended product	WLG (see page C-8)
Limiting range	**1.5 m**
Resolution (beam separation)	**12.5 mm**
Detection height	**87.5 mm**
Response time	**0.6 ms (parallel beam)**

C

HLG – edge control

In mail sorting systems, different shaped objects run on conveyor belts at high speed. To determine their exact length, the leading edge of the object must be reliably detected. Thanks to its high resolution and fast response time across the entire width of the conveyor belt, the **HLG** is the ideal solution for this application.

Recommended product	HLG (see page C-14)
Limiting range	**2 m**
Resolution (beam separation)	**2 mm**
Detection height	**50 mm**
Response time	**3 ms (parallel beam)**

ELG Short Range – separation control

At airports, suitcases must be arranged on conveyor belts before arriving in the passenger area so that they do not collide. The **ELG Short Range** can reliably detect the edges of objects and the leading edge of different suitcases.

Recommended product	ELG Short Range (see page C-20)
Limiting range	**4 m** *)
Resolution (beam separation)	**10 mm / 30 mm**
Detection height	**90 mm ... 930 mm**
Response time	**14 ms** *)

*) Type-dependent.

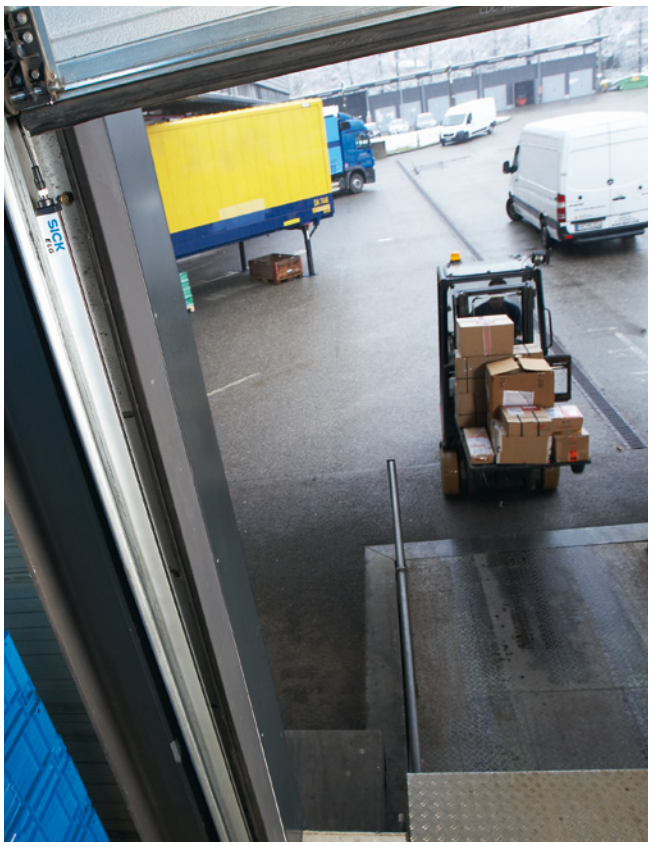
C

ELG Long Range – monitoring industrial doors

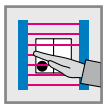
The **ELG Long Range** offers high immunity to ambient light and a wide working range for monitoring industrial doors. The ELG Long Range is also the ideal solution for large detection heights.

Recommended product	ELG Long Range (see page C-28)
Limiting range	**17 m**
Resolution (beam separation)	**30 mm / 60 mm**
Detection height	**150 mm ... 3,330 mm**
Response time	**28 ms** *)

*) Type-dependent.



PLG – pick-to-light for error-free commissioning



Task

When commissioning a production order (e.g., final assembly or engine production in the automotive industry) or a sales order in warehouses or distribution centers, various sub-quantities may have to be put together to complete the order or process. The objective is to ensure error-free picking and to reliably guide the machine operator.

Process

The PLG3 and PLG6 sensors are located in each storage bay and have an integrated job LED for displaying the picking position, confirming correct access or indicating an incorrect pick. A strip of reflective tape on the back side of every PLG3 and PLG6 sensor also serves as the reflector for the next PLG in the neighboring storage bay. The row also requires another strip of reflective tape.

Solutions

Thanks to an integrated polarizing filter, the **PLG3** is highly immune to glare. It has a 30 mm beam separation and is available with various detection heights. The integrated green job LED reduces order-picker search time.

With a beam separation of 60 mm, the **PLG6** is particularly suitable for short detection heights. At the front of the housing, it has an integrated red job LED that is visible to the worker at a 360° angle and can draw the worker‘s attention to the correct “picking” position or to faulty engagement.

Selection guide

Light grid type	Chapter			Limiting range in m	Beam separation in mm	Detection height in mm	Job LED
PLG3	C-38		●	2	30	120, 210, 270, 360, 420	Green, visible from 360°
PLG6	C-44		●	0.5	60	60	Red, visible from 360°
SPL	D-20	●		3	40	120 ... 440	Green, across entire light grid length at sender and receiver, visible from 180°

C

Versatile, compact, reflex light grid

C

Product description

The WLG is a retro-reflective light grid with a 100 mm detection height and 8 LEDs. Detecting damaged pallets, checking the edges of material webs and detecting and sorting bottles are ideal applications for the WLG. It is possible to detect objects which are only 6 mm in size at a distance of 0.4 m. Transparent objects and reflective surfaces can also be detected reliably.

At a glance

- The direct output of individual beams for measuring and switching
- Response time 0.6 ms
- Eight visible transmission LEDs
- Eight PNP switching outputs and one alarm output
- Sensitivity can be set via a potentiometer
- Polarizing filter for reflective surfaces

Your benefits

- The WLG's fast response time keeps up with increased conveyor speeds, increasing throughput
- Detects translucent and semi-transparent objects for consistent detection of most objects
- Retro-reflective sensor saves space, installation time and cost
- Polarized retro-reflective light grids are designed to detect difficult reflective targets, such as stretch wrap and other thin films
- Visible red light reduces assembly time
- Multiple output versions indicate detection position and size of the object for closed loop process feedback and inspection

Detailed technical data

Features

Technology	Retro-reflective light grid
Task	Switching light grid
Minimum detectable object (MDO)	Parallel beam: ≥ 6 mm ... 12 mm
Number of beams	8
Resolution (adjustable) [1]	6 mm to 12.5 mm

[1] Dependence of the range.

Performance

Maximum range	1.5 m
Minimum range	≥ 100 mm
Response time [1]	Parallel beam: 0.6 ms

[1] With resistive load.

Interfaces

Connection type	Connector M12, 5-pin Cable 12-pin

Mechanics/electronics

Wave length	650 nm
Supply voltage V_S [1]	DC 15 V ... 30 V
Power consumption sender [1]	< 80 mA
Ripple	< 5 V_{PP}
Output current $I_{max.}$	100 mA
Output load capacitive	100 nF
Output load inductive	1 H
Initialization time	0.6 s
Dimensions (W x H x D)	62 mm x 106 mm x 46.6 mm
Housing material	Aluminum
Indication	LED
Enclosure rating	IP 67
Circuit protection	V_S connections reverse-polarity protected Output Q short-circuit protected Interference suppression
Weight	230 g
Front screen	PMMA
Output mode [2]	Q dark switching
Teach input	PNP

[1] Typical values.

[2] Q = active in case one beam is interrupted; /Q = active in case all beams are free.

Ambient data

Protection class	II
EMC	EN 60947-5-2
Ambient temperature	Operation: –25 °C ... +55 °C Storage: –20 °C ... +70 °C
Vibration resistance	5 g, 10 Hz ... 55 Hz (IEC 68-2-6)
Shock load	10 g / DIN EN 60068-2-29 / 16 ms

C

High-resolution and high-speed detection of the smallest objects

Product description

The high-resolution HLG light grid from SICK is the ideal solution for all applications in which very flat or small objects need to be detected. The HLG is particularly useful when the packages do not have a uniform leading or trailing edge, such as pillow and wedge-shaped objects (bags and single serving size food packages). Its 2 mm resolution, fast 3 ms response time, and low switching hysteresis are ideal for fast mail handling systems, packaging machines with high throughput, and part ejection verification on molding and stamping machines.

At a glance

- 2 mm resolution
- Response time 3 ms
- Detection height 50 mm
- Cable synchronization
- PNP or NPN with both Q and Qnot outputs (NO/NC)
- 1 x test, 1 x teach-in input
- Connector M12, 8-pin

Your benefits

- Reliable object detection throughout the entire working range ensures consistent and reliable operation
- High availability thanks to its ability to detect very flat objects
- The HLG's short response time allows the use of higher conveyor speeds directly leading to higher throughput
- Cable synchronization provides more reliable use and higher machine uptime
- Highest measurement resolution provides smallest minimum detectable object size, for exact counting and true leading edge detection of conveyed objects, for more machine control and increased throughput

C

C

Reliable detection and counting

C

Product description

SICK offers the ELG Short Range (up to 3 m), an extremely tough switching automation light grid, with 10 and 30 mm beam separations and up to a 3,300 mm detection height. It is used in logistics for detecting the front edges of objects and counting boxes. The cross beam function enables the detection of smaller parts. The ELG Short Range was developed for simple switching applications.

At a glance

- Up to 16 beams with 10 mm and 112 with 30 mm beam separation
- Range up to 5 m
- Potentiometer for sensitivity setting
- Ambient light up to 150,000 lux
- Tough, aluminum housing
- PNP/NPN output and a test input
- Optical synchronization

Your benefits

- Efficient and effective way to combine multiple sensors in one housing with one connector
- Simple commissioning thanks to a larger optical aperture angle and manual fine adjustment option
- Optical synchronization enables quick installation and cost-effective connection
- The ELG Short Range reliably detects objects, even under challenging ambient conditions

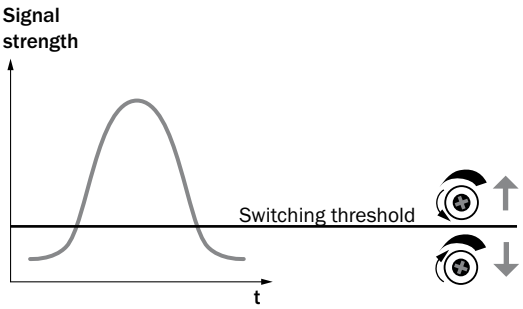
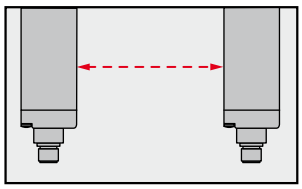
Sensitivity adjustment



Optical synchronisation



The light grid communicates via the light beams. A cable is not necessary for the optical synchronisation.

C

The tough automation light grid

Product description

The ELG Long Range (up to 12 m) automation light grid is extremely tough and offers different detection heights and beam separations. The ELG is immune to glare caused by light. It is used in logistics for checking for overhang on pallets and counting boxes. The ELG is used mainly for the protection of industrial roller shutter gates and outdoors to separate vehicles. The ELG is available with up to 128 beams and with a minimum beam resolution of 30 mm.

At a glance

- Up to 128 beams
- Different beam separations 30 mm and 60 mm
- High functional reserve (gain) for ranges up to 12 m
- Potentiometer for sensitivity setting
- Ambient light up to 150,000 lux
- Tough, aluminum housing
- PNP/NPN/relay output and a test input
- Optical synchronization

Your benefits

- Insensitive to ambient light when exposed to direct sunlight, strobe lights, and highly reflective objects, eliminating false trips
- High functional reserve (excess gain) ensures operation even if it gets dirty, dusty, or misaligned, reducing maintenance costs
- Efficient and effective way to combine multiple sensors in one housing with one connector
- Simple commissioning thanks to a larger optical aperture angle and manual fine adjustment option
- Optical synchronization enables quick installation and cost-effective connection
- The sensitivity adjustment can be used to detect or ignore translucent materials to reduce production problems

C

Simply clever order picking verification

Product description

Using sensors for order picking has become standard in the automotive and logistics industries. Using the PLG automation light grid for order picking offers significant advantages over conventional, manual order picking technology. The PLG is mounted at each storage bay and has an integrated job LED to display pick position.

The PLG's single-sided strip of reflective tape saves space in the bin and reduces damage and installation costs. Thanks to an integrated polarizing filter, the PLG won't be fooled by shiny or reflective clothing.

At a glance

- 360° visible job LED
- Range up to 2 m
- Flexible detection heights from 120 mm to 420 mm
- Immune to reflected and ambient light
- Switchable job LED: permanently lit or flashing
- Optically confirms the right bin was picked
- Bus connection possible

Your benefits

- The integrated job LED reduces the order picker's search time
- Low assembly costs thanks to the PLG's clever design
- High availability thanks to an integrated polarizing filter
- Tough aluminum housing ensures that sensor damage is kept to a minimum and helps reduce repair costs
- Reflective tape on the sensor avoids additional assembly and cabling costs

C

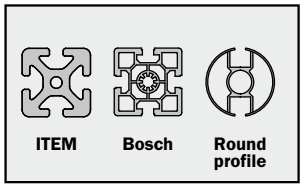
Special functions

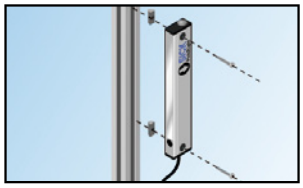
Easy installation

1. Easy mounting on to different profiles



The light grid can be mounted on different profiles, e.g. ITEM, Bosch, round profile.

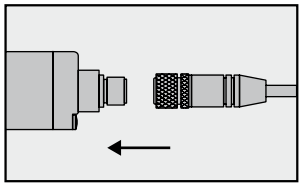
2. Easy installation with slot nuts



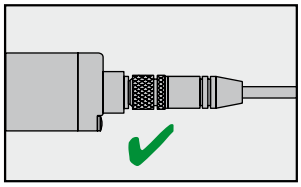
The PLG can easily be mounted on the profile with slot nuts.

Plug & play

1. Plug in and tighten the ring of the connector



2. Device is ready for use



C

Increase pick rates in compact installations

Product description

Using sensors for order picking has become standard in the automotive and logistics industries. Using the PLG automation light grid for order picking offers significant advantages over conventional, manual order picking technology. The PLG is mounted at each storage bay and has an integrated job LED to display pick position.

The PLG's single-sided strip of reflective tape saves space in the bin and reduces damage and installation costs.

At a glance

- 360° visible job LED
- Detection height 60 mm
- Optically confirms the right bin was picked
- Bus connection possible
- The smallest pick-to-light light grid

Your benefits

- The integrated job LED reduces the order picker's search time
- Low assembly costs thanks to the PLG's clever design
- Tough aluminum housing ensures that sensor damage is kept to a minimum and helps reduce repair costs
- Reflective tape on the sensor avoids additional assembly and cabling costs

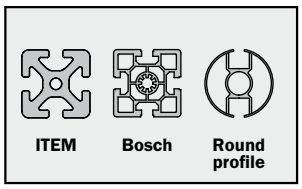
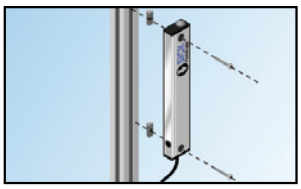
Easy installation

1. Easy mounting on to different profiles



The light grid can be mounted on different profiles, e.g. ITEM, Bosch, round profile.

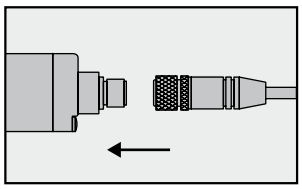
2. Easy installation with slot nuts



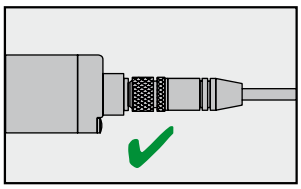
The PLG can easily be mounted on the profile with slot nuts.

Plug & play

1. Plug in and tighten the ring of the connector



2. Device is ready for use



C

C

Smart, slender, stealth

The smart light grid family group includes smart area sensors, smart gate sensors and smart pick-to-light light grids. At only 8 mm x 25 mm, they fit nearly anywhere and can be imbedded inside walls, doors, conveyors, and machines. Slim and flat versions are available. They can be ordered in 120 to 1,400 mm lengths in a plastic or aluminum housing. Auto-muting, auto-teach and an alignment aid provide more uptime. They are ideal for order-picking, automatic doors, counting objects and other applications.

Your benefits

- Small, slim and sleek design enables easy integration into applications
- Capacitive teach-in button and LEDs make commissioning easier for complex solutions
- Slim and flat models offer flexible mounting options
- User-defined factory preset configuration or flexible configuration with teach-in button
- Optical synchronization eliminates the need to lay cables, saving time
- Stealth detection in public places – at only 8 mm x 25 mm, it fits just about anywhere and can be imbedded inside walls, doors, conveyors, and machines, reducing damage
- Auto-teach and auto-muting enable Plug & Play. And, an alignment aid and “Click & Go” provide faster installation.

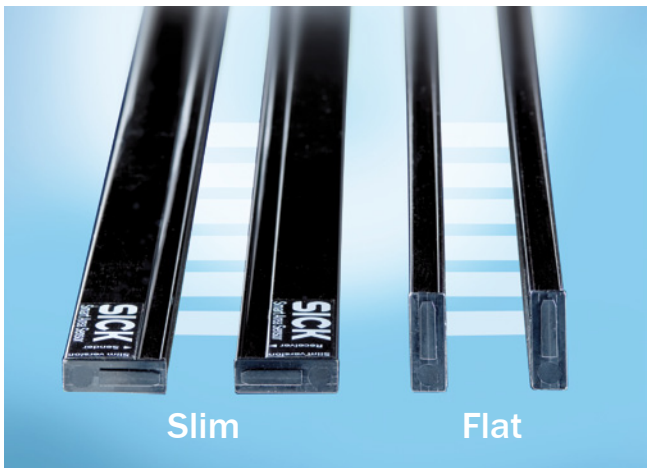
Smart light grids

D

Whether slim, flat, short or long, nothing can get past smart light grids unnoticed

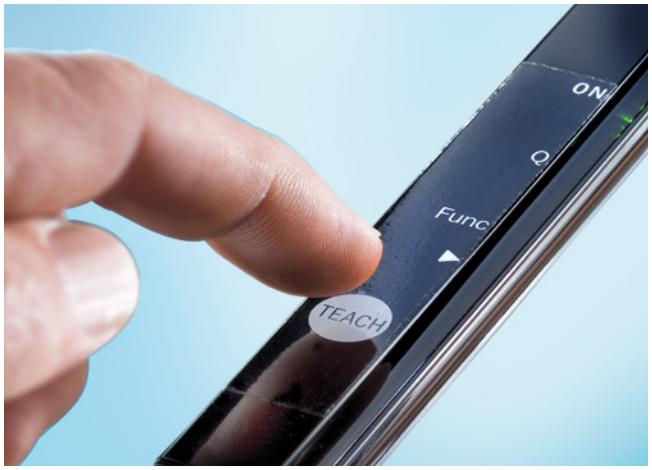
D

Smart light grids from SICK ensure nothing goes unnoticed and are available in range of variants for many types of applications. With a depth of just 8 mm and a width of 25 mm, various lengths and a choice of optical light exit, they are suitable for virtually all situations and can be integrated into walls, doors, conveyor belts, machines or shelves – from industrial gates to stocking small parts.



Slim & Flat – one housing profile, two options of optical light exit
Slim model = optical light exit on narrow side.
Flat model = optical light exit on wide side.

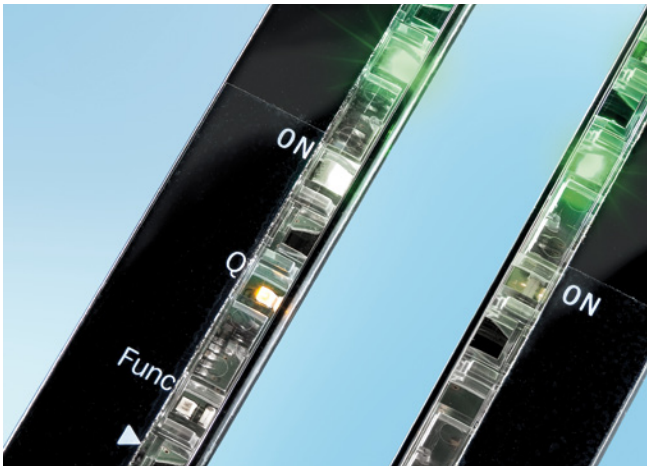
Short & long – it's your choice
Smart light grids from SICK are available in several lengths with various detection heights.



Plug & Play – and teachable versions available
Two options are available for maximum flexibility: set the range in the field with the clever teach button or choose a factory pre-configured option.

Click & Go – simple assembly concept
The "multi-connector" can be used to fasten smart light grids or for mechanical connection to another light grid. A specially developed aluminum housing makes mounting even easier.

LED indicator – visible indication of right or wrong
The integrated inspection unit with LEDs makes for easier commissioning, diagnostics and fault analysis – providing clear feedback for greater reliability.



Job LEDs – indicate not just where but precisely where
With the SPL smart pick-to-light light grid, individually switchable and 180°-visible green job LEDs are distributed across the entire detection height. For example when several components are located in one compartment stacked on top of one another, the light grids not only tell operators which compartment to reach into, but also indicate the height at which to do so.

The smart light grids (SLG) product family consists of the smart area sensor (SAS), smart gate sensor (SGS) and smart pick-to-light light grid (SPL) automation light grids.
Typical applications can be found on the following pages.

D

SPL – pick-to-light operator guidance

SAS – checking for overhang

SAS light grids are the perfect solution for numerous industrial automation tasks for and in machines. Their small size enables them to be used in virtually all situations, e.g. for checking overhang in the electronics industry.

Recommended product	SAS (see page D-8)
Limiting range	**4 m**
Resolution (beam separation)	**40 mm**
Detection height	**120 mm ... 600 mm**
Response time	**< 20 ms**

The SPL light grid provides effective support for picking in small parts racks since indicator and job LEDs are visible across its entire detection height. A window appears enabling you to immediately detect at a glance all the current removal compartments. A further benefit of the SPL is its integrated monitoring system for incorrect removals – as soon as a part is removed from a compartment which has not been indicated, the job LED will light up red. The SPL therefore makes a valuable contribution to quality assurance.

➔ **For more information and other "pick-to-light" light grids by SICK, see page C-5.**

Recommended product	SPL (see page D-20)
Limiting range	3 m
Resolution (beam separation)	40 mm
Detection height	120 mm ... 440 mm
Response time	< 20 ms

Selection guide

Light grid type	Chapter			Limiting range in m	Beam separation in mm	Detection height in mm	Job LED
PLG3	C-38		●	2	30	120, 210, 270, 360, 420	Green, visible from 360°
PLG6	C-44		●	0.5	60	60	Red, visible from 360°
SPL	D-20	●		3	40	120 ... 440	Green, across entire light grid length at sender and receiver, visible from 180°

SGS – door/gate monitoring

Their large 10 m range and detection heights of up to 1.40 m mean SGS light grids by SICK are tried and tested in the widest applications such as monitoring of entrances and exits for vehicles at industrial sites. Their particularly narrow design enables them to be installed virtually invisibly for use as an innovative monitoring system at turnstiles in airports and train stations. Here, SGS light grids will ensure turnstiles do not close after the person has exited if objects are still located within the turnstile.

Recommended product	SGS (see page D-30)
Limiting range	10 m
Min. resolution (beam separation)	40 mm
Detection height	600 mm ... 1,400 mm
Response time	< 20 ms

D

Better machine control in a small housing

Product description

The SAS light grid is an easy-to-install solution used on production, manufacturing, and fabricating machines. Thanks to its range of sizes, slim and sleek design, as well as special options the SAS light grids are ideal for a range of applications. The SAS is available in a flat and slim housing and is suitable for detection heights from 120 mm to 600 mm. The software is accessed via an integrated teach-in button, offering the choice between parallel technology or even higher-resolution cross-beam technology. In addition, auto-muting, switching logic and an alignment aid provide more uptime.

At a glance

- Variable detection lengths from 120 mm up to 600 mm (in 160 mm increments)
- Set parameters via teach-in with no PC
- Simple teach-in setup
- Maximum range 4 m
- Response time 18 ms
- 25 mm resolution with 40 mm beam separation possible
- Highly immune to sunlight up to 150,000 lux
- Small blind zone < 11 mm

Your benefits

- Small, slim and sleek design enables easy integration into applications
- Capacitive teach-in button and LEDs make commissioning easier for complex solutions
- Slim and flat models offer flexible mounting options and optimize space while reducing damage
- Customized preset configurations or set parameters via one-touch teach-in with no PC
- Optical synchronization eliminates the need to lay cables, saving time
- Auto-teach and auto-muting enable Plug & Play. And, an alignment aid and “Click & Go” provide faster installation.

Detailed technical data

Features

Technology	Sender/receiver
Task	Switching light grid
Minimum detectable object (MDO)	Parallel beam: ≥ 45 mm Cross beam: ≥ 25 mm
Number of beams	4 ... 16
Configuration	Teach button with configuration software [1]
Software features	Parallel beam Cross beam Output 1 high active/low active (normally open/closed), if light beam interrupted Automatic teach active/inactive With/without alignment aid

[1] For all T-types (cf. type code).

Performance

Maximum range [1]	4 m
Minimum range [2]	Parallel beam: ≥ 0 m Cross beam: ≥ 0.3 m
Response time	Parallel beam: 19 ms Cross beam: 57 ms

[1] No reserve for environmental issue and deterioration of the diode.

[2] ± 10°.

Interfaces

Inputs	Teach input
Connection type	Short cable with connector M8, 4-pin

Mechanics/electronics

Wave length	IR, 950 nm
Supply voltage V_S	DC 24 V ± 20 %
Power consumption sender [1]	64 mA ... 136 mA
Power consumption receiver [1]	70 mA
Ripple	< 5 V_{PP}
Output current $I_{max.}$	100 mA
Output load capacitive	100 nF
Output load inductive	1 H
Initialization time	1 s
Dimensions (W x H x D)	25 mm x 192.4 mm x 8 mm ... 25 mm x 672.4 mm x 8 mm
Housing material	PMMA
Indication	LED
Synchronization	Optical
Enclosure rating	IP 65
Circuit protection	V_S connections reverse-polarity protected Output Q short-circuit protected Interference suppression
Weight	20 g ... 80 g
Switching frequency	500 kHz

[1] Without load.

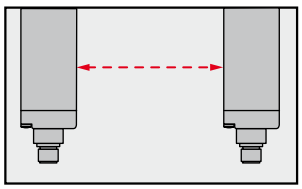
Special functions

Optical synchronisation

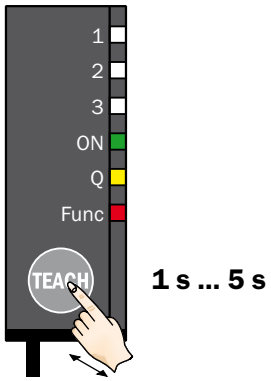


The light grid communicates via the light beams. A cable is not necessary for the optical synchronisation.

D

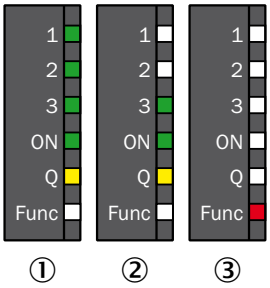
Setting the switching threshold via teaching process

1. Light grid in RUN mode, green LED “ON” illuminates, yellow LED “Q” illuminates.



Press the teach button for 1 s to 5 s. During the teach process the green LEDs illuminates sequentially. The red LED “Func” illuminates.

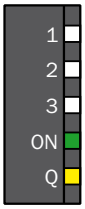
2. Alignment aid is automatically activated for 10 s.



① = Optimum light reception.
② = Light reception not optimized,
➜ **align sensors**.
③ = No light received,
➜ **check light path.**

The light grid switches after 10 s automatically back into the RUN mode.

3. Light grid in RUN mode, green LED “ON” illuminates, yellow LED “Q” illuminates.



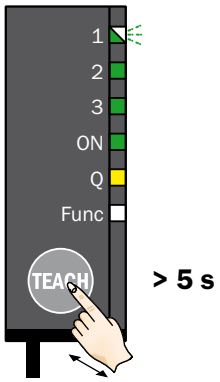
The switching threshold is set.

D

Configuration mode using the example of “cross beam/parallel beam”

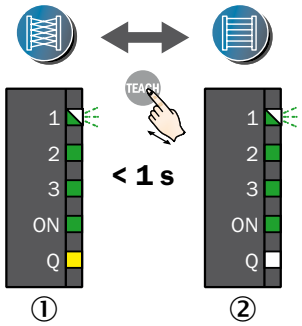
If the teach button is pressed longer than 5 s, you switch into the configuration mode. In the configuration mode the menu items are indicated by the green LEDs. If the teach button is then pressed for < 1 s, the respective function is activated or reset (yellow LED on or off). If the teach button is pressed for 1 s to 5 s long, you switch to the next menu item. To exit the configuration mode, press the teach button for > 5 s or wait for 30 s.

1. Light grid in RUN mode, green LED “ON” illuminates, yellow LED “Q” illuminates.



Press teach button > 5 s.
The light grid switches into the configuration mode – menu item “cross beam/parallel beam”.
The first green LED from top flashes.

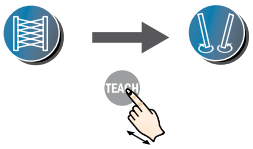
2. Cross or parallel beam set up. [1]



① = Yellow LED on,
➜ “Crossed beam” active.
② = Yellow LED off,
➜ “Parallel beam” active.

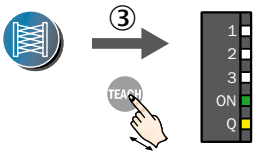
Press teach button < 1 s to switch between the settings.

3. Go to the next menu item.

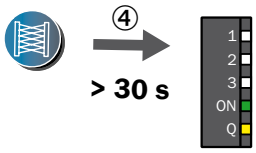


Press teach button for 1 s to 5 s to switch to the next menu item (in this case “alignment aid”).

4. Exit the configuration mode.



oder



③ = Press teach button > 5 s,
➜ save parameters.
④ = Wait > 30 s,
➜ parameters not saved.

[1] Configure the light grid in a 3-way cross-beam or a parallel-oriented operating principle. The cross beam can be used to improve the resolution in the middle detection area. Objects up to a size of 25 mm can be detected. The response time increases.

D

The other menu items in sequence of the menu setting of the light grid

Alignment aid [2]	Invert switching output	Auto-teach [3]	Pushbutton lock	Standard values [4]
active	Q_1	active	active	active
inactive	$\overline{Q_1}$	inactive	inactive	inactive

[2] The alignment aid is recommended for applications with high ranges. The signal strength of the receiver is permanently displayed by four green alignment LEDs. Depending on the strength, the number of illuminated LEDs differ. When reception is strong, all four LEDs illuminate. The alignment aid must be deactivated again after alignment.
[3] After commissioning (power on), the switching threshold is taught in automatically. No object should be between the sender and receiver during this process.
[4] With standard values “active” all parameters are reset to the delivery state.

D

Error-proof picking

Product description

The SPL pick-to-light light grid from SICK ensures optimum picking accuracy, reducing errors and improving quality. The SPL is an operator-friendly light grid – the ergonomic and economical solution for access control and picking control. The green job LEDs indicate the correct picking bin to the operator and optically confirms that the correct item has been picked. The red LED lights when there is a picking error. This means no wrong components are used, no missing parts and no rework. In addition, features such as auto-muting, auto-teach, and an alignment aid provide more uptime. The SPL ensures process reliability and quality.

At a glance

- Variable detection lengths from 120 mm up to 440 mm
- No commissioning necessary – Plug & Play operation
- Maximum range 3 m
- Response time 18 ms
- 25 mm resolution with 40 mm beam separation possible
- Highly visible job LEDs along the entire length of the sensor
- Green job LEDs for correct pick and red job LEDs for incorrect pick
- Can be connected to bus systems

Your benefits

- Highly visible job LEDs can be seen from any position
- Picking error display for order picking improves quality
- Plug & Play operation saves time
- Automatic teach-in when turned on
- Slim and flat models offer flexible mounting options and optimize shelf/bin space while reducing damage
- Quick, cost-effective installation thanks to optical synchronization – no need to wire the sender and receiver together
- Auto-muting, auto-teach and an alignment aid provide more uptime

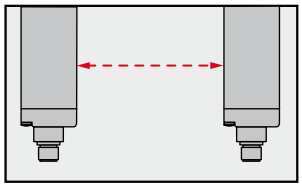
For additional accessories including dimensional drawings, please see page E-14.

D

Special functions

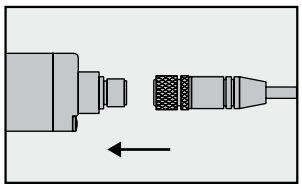
Optical synchronisation



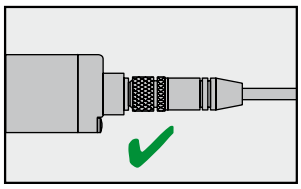
The light grid communicates via the light beams. A cable is not necessary for the optical synchronisation.

Plug & Play

1. Plug in and tighten the ring of the connector

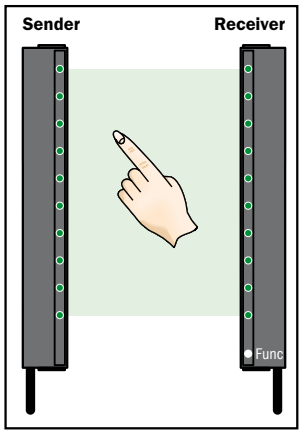


2. Device is ready for use



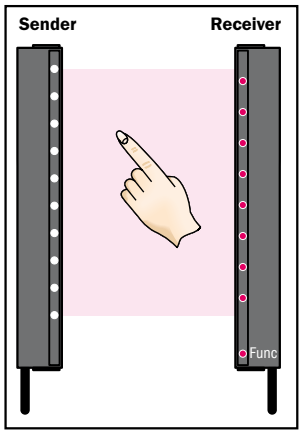
Job-LED

1. Object picking from the indicated bin



The “green” Job LEDs indicate the correct picking bin to the operator and confirm optically that the correct picking has taken place.

2. Incorrect picking



The “red” Job LEDs light in case of picking errors. The function LED “Func” will also turn “red” to indicate a picking error.

D

Opens the door to smart sensing

Product description

SGS can be mounted inside doors, gates, and entry/exit points. As a result, they are the largest light grids of the SLG product family group, are taught by remote wire, and have the longest sender to receiver span. SGS light grids can be commissioned quickly thanks to their simple "Click & Go" assembly feature and setup. In addition, features such as auto-muting, auto-teach, and an alignment aid provide more uptime. A specially developed multi-connector also makes it easy to connect a series of multiple SGS light grids to a larger unit. Available with optional aluminum stabilizer for stand-alone mounting – it's that simple!

At a glance

- Variable detection lengths from 600 mm up to 1,400 mm (in 160 mm increments)
- Simple teach-in setup via cable
- Optional parameter setting with teach-in button, no PC required
- Maximum range 10 m
- Response time 18 ms
- 25 mm or 45 mm MDO possible
- Highly immune to sunlight at 150,000 lux
- Small blind zone < 11 mm

Your benefits

- Small, slim and sleek design enables easy integration into applications
- Slim and flat models offer flexible mounting options and optimize shelf/bin space while reducing damage
- Customized preset configurations or set parameters via one-touch teach-in with no PC
- Optical synchronization eliminates the need to lay cables, saving time
- Optional: Capacitive teach-in button and LEDs make commissioning easier for complex solutions
- Auto-teach and auto-muting enable Plug & Play. And, an alignment aid and "Click & Go" provide faster installation.

D

Detailed technical data

Features

Technology	Sender/receiver
Task	Switching light grid
Minimum detectable object (MDO)	Parallel beam: ≥ 45 mm ... 85 mm Cross beam: ≥ 25 mm
Number of beams	8 ... 36
Configuration	Teach button with configuration software [1]
Software features	Parallel beam Cross beam Output 1 high active/low active (normally open/closed), if light beam interrupted Automatic teach active/inactive With/without alignment aid Output 2 active/inactive (normally open/closed), if light beam interrupted With/without muting function at output 2 With/without muting function

[1] For all T-types (cf. type code).

Performance

Maximum range [1]	4 m 10 m
Minimum range [2]	Parallel beam: ≥ 0 m Cross beam: ≥ 0.3 m
Response time	Parallel beam: 19 ms Cross beam: 57 ms

[1] No reserve for environmental issue and deterioration of the diode.

[2] ± 10°.

Interfaces

Inputs	Teach input
Connection type	Short cable with connector M8, 4-pin Short cable with connector, M12, 4-pin Cable open end

D

Mechanics/electronics

Wave length	IR, 950 nm
Supply voltage V_S	DC 24 V ± 20 %
Power consumption sender [1]	88 mA ... 148 mA
Power consumption receiver [1]	70 mA
Ripple	< 5 V_{PP}
Output current $I_{max.}$	100 mA
Output load capacitive	100 nF
Output load inductive	1 H
Initialization time	1 s
Dimensions (W x H x D)	25 mm x 672.4 mm x 8 mm ... 25 mm x 1,472.4 mm x 8 mm (SGS4) 25 mm x 932.4 mm x 8 mm ... 25 mm x 1,432.4 mm x 8 mm (SGS8)
Housing material	PMMA
Indication	LED
Synchronization	Optical
Enclosure rating	IP 65
Circuit protection	V_S connections reverse-polarity protected Output Q short-circuit protected Interference suppression
Weight	80 g ... 360 g
Switching frequency [2]	500 kHz 250 kHz

[1] Without load.

[2] Depending on type.

Ambient data

Protection class	III
EMC	EN 60947-5-2
Ambient temperature	Operation: –25 °C ... +55 °C Storage: –25 °C ... +70 °C
Ambient light safety [1]	Direct: 100,000 lx Indirect: 150,000 lx
Vibration resistance	5 g, 10 Hz ... 55 Hz (IEC 68-2-6)
Shock load	10 g / DIN EN 60068-2-29 / 16 ms

[1] Sunlight.

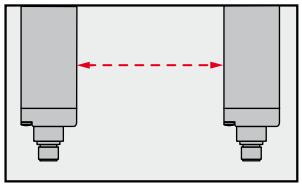
For additional accessories including dimensional drawings, please see page E-14.

Special functions

Optical synchronisation

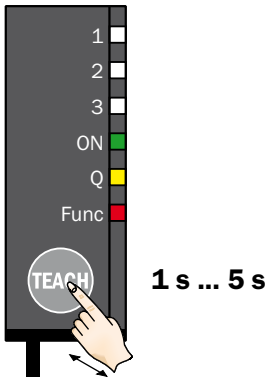


The light grid communicates via the light beams. A cable is not necessary for the optical synchronisation.

D

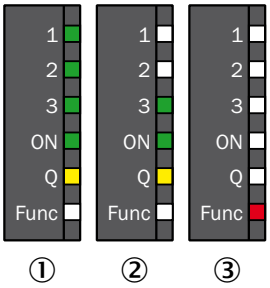
Setting the switching threshold via teaching process

1. Light grid in RUN mode, green LED “ON” illuminates, yellow LED “Q” illuminates.



Press the teach button for 1 s to 5 s. During the teach process the green LEDs illuminates sequentially. The red LED “Func” illuminates.

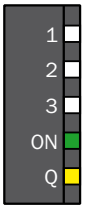
2. Alignment aid is automatically activated for 10 s.



① = Optimum light reception.
② = Light reception not optimized,
➜ **align sensors**.
③ = No light received,
➜ **check light path.**

The light grid switches after 10 s automatically back into the RUN mode.

3. Light grid in RUN mode, green LED “ON” illuminates, yellow LED “Q” illuminates.



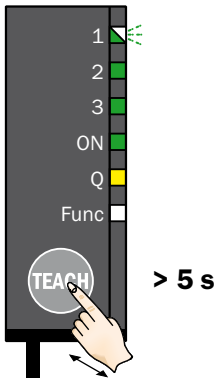
The switching threshold is set.

D

Configuration mode using the example of “cross beam/parallel beam”

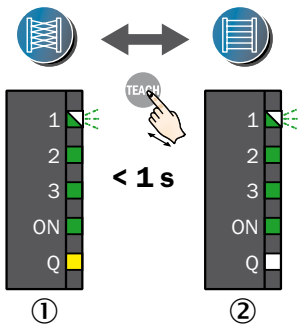
If the teach button is pressed longer than 5 s, you switch into the configuration mode. In the configuration mode the menu items are indicated by the green LEDs. If the teach button is then pressed for < 1 s, the respective function is activated or reset (yellow LED on or off). If the teach button is pressed for 1 s to 5 s long, you switch to the next menu item. To exit the configuration mode, press the teach button for > 5 s or wait for 30 s.

1. Light grid in RUN mode, green LED “ON” illuminates, yellow LED “Q” illuminates.



Press teach button > 5 s.
The light grid switches into the configuration mode – menu item “cross beam/parallel beam”.
The first green LED from top flashes.

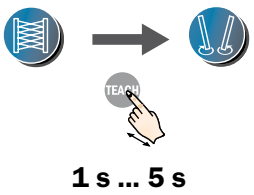
2. Cross or parallel beam set up. [1]



① = Yellow LED on,
➜ “Crossed beam” active.
② = Yellow LED off,
➜ “Parallel beam” active.

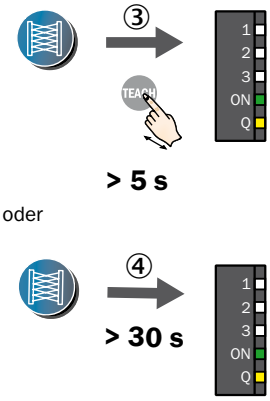
Press teach button < 1 s to switch between the settings.

3. Go to the next menu item.



Press teach button for 1 s to 5 s to switch to the next menu item (in this case “alignment aid”).

4. Exit the configuration mode.



③ = Press teach button > 5 s,
➜ save parameters.
④ = Wait > 30 s,
➜ parameters not saved.

[1] Configure the light grid in a 3-way cross-beam or a parallel-oriented operating principle. The cross beam can be used to improve the resolution in the middle detection area. Objects up to a size of 25 mm can be detected. The response time increases.

D

The other menu items in sequence of the menu setting of the light grid

Alignment aid [2]	Invert switching output	Auto-teach [3]	Pushbutton lock	Standard values [4]	Invert second switching output	Muting [5]
active	Q_1	active	active	active	Q_2	active
inactive	$\overline{Q_1}$	inactive	inactive	inactive	$\overline{Q_2}$	inactive

[2] The alignment aid is recommended for applications with high ranges. The signal strength of the receiver is permanently displayed by four green alignment LEDs. Depending on the strength, the number of illuminated LEDs differ. When reception is strong, all four LEDs illuminate. The alignment aid must be deactivated again after alignment.
[3] After commissioning (power on), the switching threshold is taught in automatically. No object should be between the sender and receiver during this process.
[4] With standard values “active” all parameters are reset to the delivery state.
[5] If a beam is interrupted permanently, it disappears after > 60 s, and the switching output Q_1 is enabled again. If a second switching output is present, it remains inactive.

A winning combination: sensors and accessories from SICK

In order to ensure optimal integration of sensors into your systems, it is essential that your accessories are perfectly tuned to each other. This applies not only to the connection and mounting systems, but also to reflectors, alignment aids and further special accessories.

Reliable signal transmission guarantees productivity – high-quality connectivity components with long service life reduce costs. That is why SICK offers the right connection systems for any application or sector, whether for the material handling, packaging, automotive or food and beverage industry. The extensive range of plug connectors and distributors makes it possible to achieve the right cabling for every application, even under the harshest and most difficult conditions.

The requirements of mounting systems for sensors are just as diverse as their areas of application. With its clever mounting concepts, SICK offers the right solutions for mounting, alignment and protection of industrial SICK sensor systems. Efficient and functional.

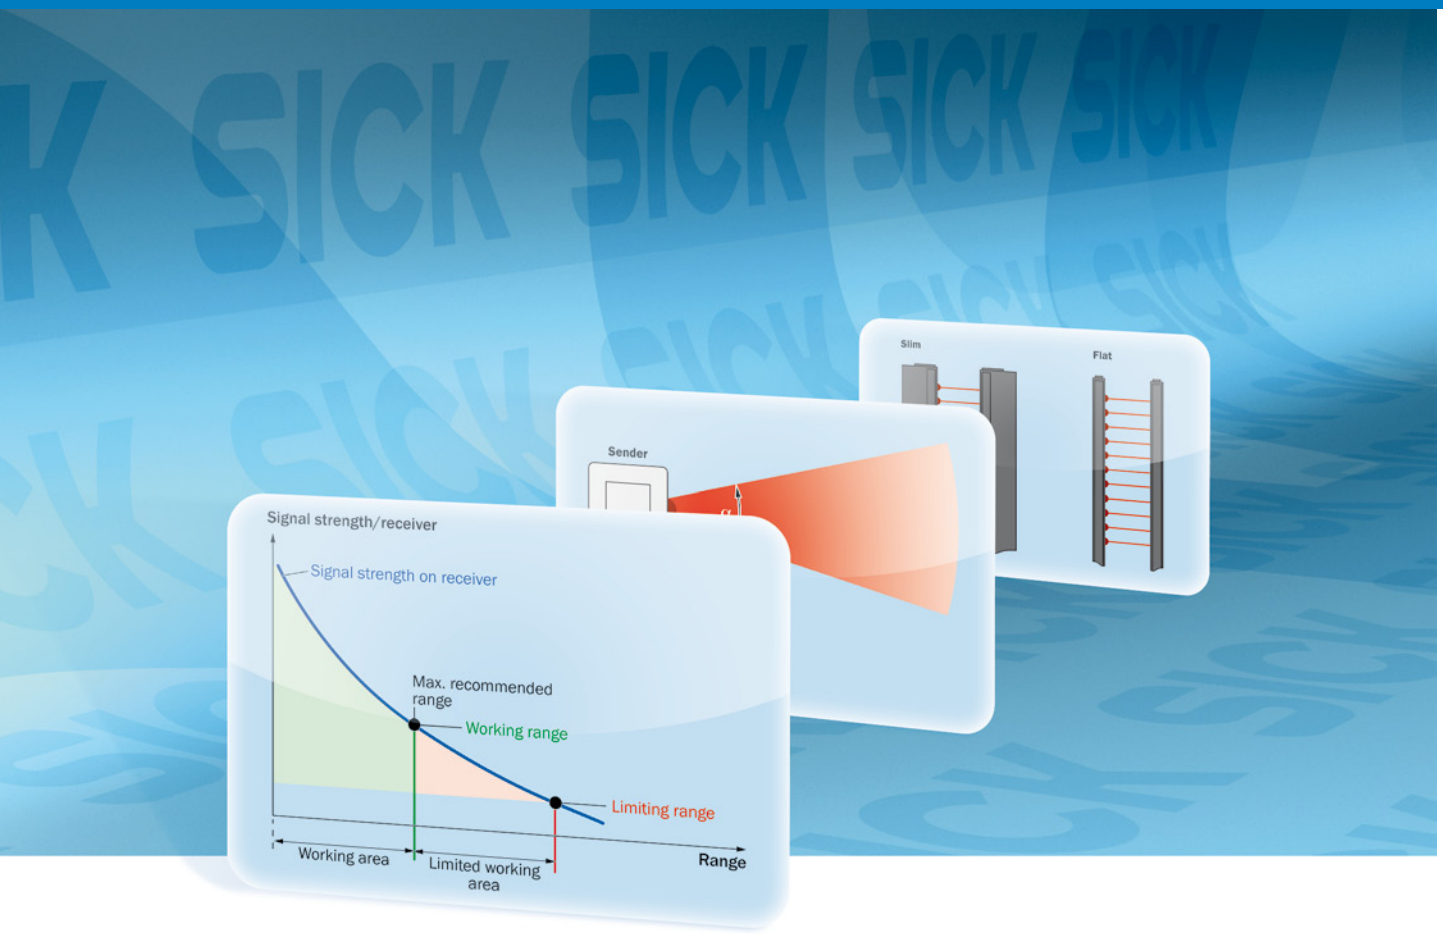
Compact info: important information about SICK sensor solutions

The following pages contain explanations of key terminology in a concise, easy-to-read form, from A for abbreviation to V for vibration resistance. Definitions of all key terms related to SICK's innovations and sensor solutions can be found here.

This glossary also provides valuable information about directives and standards such as conformity, protection classes, laser classes and much more.

F



Appendix

F

A

Abbreviations for light grids/light grid families

Abbreviations for light grids are indicative of certain product properties. Explanations are as follows:

ALG – Automation light grid

MLG – Modular light grid

XLG – Extremely sunlight-resistant light grid

WLG – Modulated light light grid

HLG – High-resolution light grid

ELG – Economic light grid

PLG – Pick-to-light light grid

SLG – Smart light grid

SAS – Smart area sensor

SGS – Smart gate sensor

SPL – Smart-pick-to-light light grid

Alarm output

▸ see output weak signal on page F-6

Alignment aid

An alignment aid, either external or integrated, helps to mutually align light grids and makes commissioning of light grids much simpler. A laser alignment aid is available as an accessory.

Ambient light safety

Light grids evaluate the light they emit and receive to determine object detection. At the same time, other light sources ranging from the sun to high-frequency radiation sources emit light too. This is known as ambient light. This light should not be allowed to affect how opto-electronic devices function, otherwise ALGs may switch incorrectly. A key requirement of users is therefore maximum ambient light safety, especially to high-frequency lights or strobe warning lamps, without any reduction of the performance of opto-electronic sensors.

Ambient temperature

The maximum ambient temperature is the highest permissible ambient air temperature at which full functional capability of the sensor is still guaranteed.

The minimum operating temperature is the lowest permissible ambient air temperature at which full functional capability of the sensor is still guaranteed.

Analog output

An analog output may be understood as an electrical output designed as a voltage or current output e. g. for simple height measurement.

Aperture angle

The aperture angle is the divergence of the light beam generated by the sender. A large aperture angle enables very simple alignment of the sender unit to the receiver unit, a smaller aperture angle reduces reflection problems.

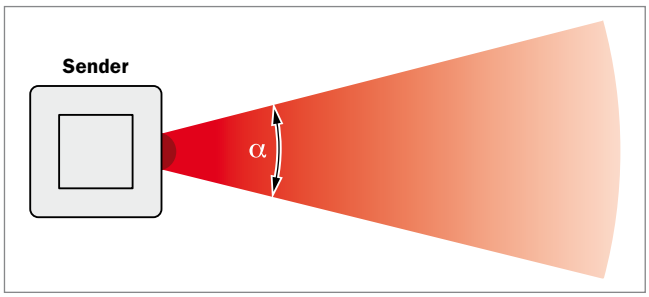


Fig. aperture angle of sender

Automatic teach

Automatic teach enables automatic teach-in of switching thresholds when the ALG is powered on.

B

Basic functions

Basic functions are functions that can be selected by customers in the MLG setup software to handle their specific application, such as the height measurement function LBB (Last Beam Blocked).

Beam coding

The beam coding is typically used with several light grids arranged side-by-side to ensure trouble-free operation. This in particular affects systems with optical synchronization. Mutual interference of several senders and receivers can thus be minimized.

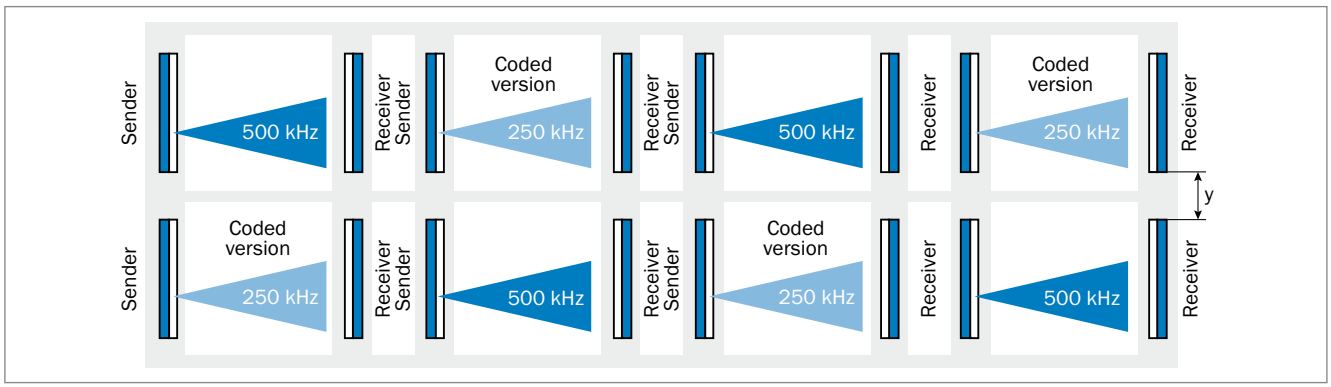

Fig. beam coding

F

Beam separation

The beam separation is the distance between the beam axes of two adjacent beams. The beam separation determines the ALG's resolution.

▸ see resolution on page F-8

▸ see fig. light grid construction on page F-5

Blind zone

The blind zone is the distance from the first or last beam to the edge of the housing in which an object cannot be detected.

▸ see fig. light grid construction on page F-5

Bus system

The bus system is a system for transferring data between several participating devices via a common cable. It allows high data transmission rates and central control of all sensors. Additional information such as process data, service data and diagnosis data can also be exchanged.

C

CAN

The CAN (Controller Area Network) is an asynchronous, serial bus system. It connects several devices with equal rights such as sensors and actuators. The data is transmitted by means of identifiers. Due to its high level of resistance to interference, real time capabilities and low costs, CAN has become an established technology in many safety-relevant areas such as automotive and automation technology. CAN is based on layer 2 according to the OSI model.

CANopen®

CANopen® is a CAN-based communication protocol. It enhances the CAN bus with a protocol structure. According to the OSI model, CANopen® is based on layer 7.

Conformity

When all relevant product safety directives are met for the relevant market, we can talk about conformity. There are essentially two binding laws within the EU for ALGs:

- EMC Directive 89/336/EEC
- Low Voltage Directive 73/23/EEC

CE

By affixing the CE mark to the product SICK, as the manufacturer, declares the requirements set out in these directives to be fulfilled.

Connection cable

Connection cables have various properties depending on their shielding material:

PVC cable

Standard material for industrial applications.

PUR cable

for special ambient conditions:

- oil-resistant
- resistant to drying out and formation of cracks

Movement of connection cables at low temperatures must be prevented as there is a risk of breaking.

Connection diagram

Wire colors are abbreviated as follows in the sensor connection diagram:

- blk = black
- blu = blue
- brn = brown
- gra = gray
- grn = green
- ora = orange
- pnk = pink
- red = red
- trq = turquoise
- vio = purple
- wht = white
- yel = yellow

The following abbreviations are used for the assignment:

- AT = blanking input
- L+ = power supply (positive pole of power supply)
- M = ground (negative pole of power supply)
- nc = not connected
- Teach = external teaching input
- Test = test input
- Q; /Q = switching output/switching output inverted (may have additional coding or numbers)
- Q_A = analog output

Cross beam

Cross beam technology is when a beam from one sender crosses over several receivers. This enables a higher resolution, at least in the central area between sender and receiver. With ALGs, triple cross beam technology is used in most cases. A higher number of beams results in a higher light grid response time.

▸ see fig. light grid construction on page F-5

D

Dark switching

▸ see light/dark switching on page F-5

F

Data interfaces

SICK ALGs are equipped with the following serial interfaces via which data can be transferred:

- RS-485 for data transmission
- RS-232 as a configuration interface for MLG setup software
- PROFIBUS
- CANopen®

Detection height

The detection height is the distance between the first and the last beam of the ALG. It thus denotes the height of the monitored area in which the object has to be located to be reliably detected.

▸ see fig. light grid construction on page F-5

Detection of partially-translucent objects

Partially-translucent objects can only be reliably detected in the monitored area if the switching threshold is set accordingly (sensitive).

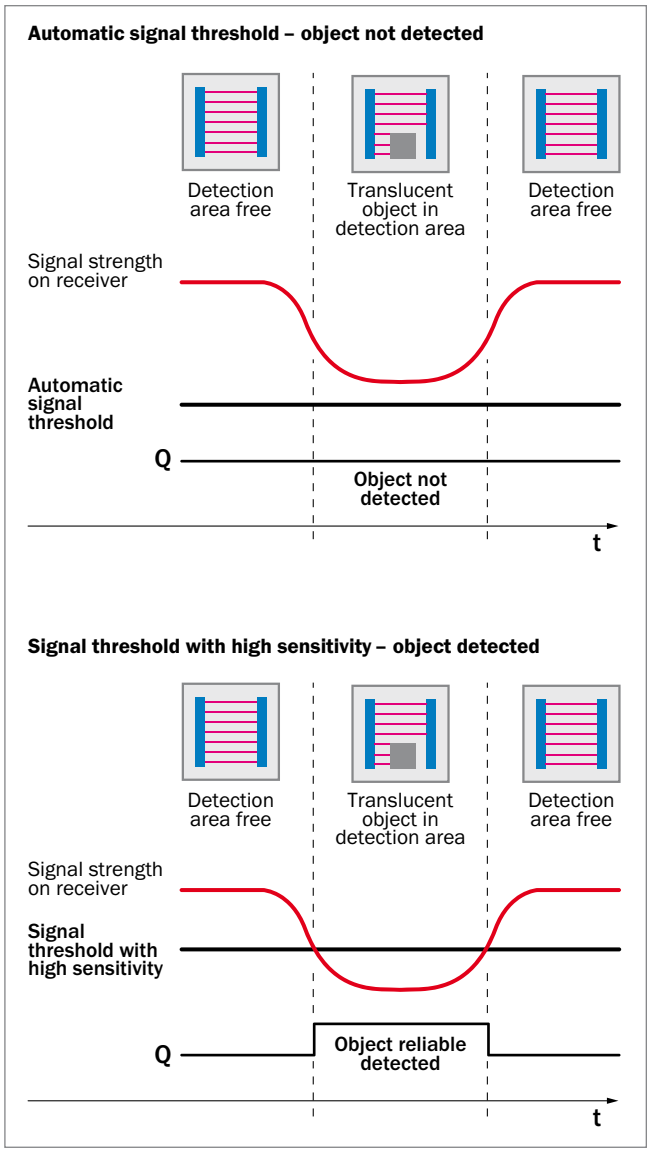

Fig. detection of partially-translucent objects

E

EDS file (CANopen®)

For use of CANopen® devices, electronic data sheets known as EDS files are required. The data they contain describes all the available parameters such as basic functions or beam statuses in a standardized text format. This enable simple configuration of the light grid by the user.

EMC

Electromagnetic compatibility (EMC) is the idea that technical devices should not be subject to interference due to electromagnetic effects. This status is attained on the one hand by restricting sources of interference in devices and on the other by designing devices to be sufficiently immune. EMC is regulated by EU Directives and Standards. SICK light grids are subject to additional in-house standards, which are stricter than the legal requirements.

Enclosure rating

The IP enclosure rating indicates the extent of a device's protection against contact with impurities such as dust or water. The code starts with the letters IP and is followed by the first digit, which is an ascending indicator of the degree of protection against contact and impurities while the second digit is an indicator of protection against ingress of water.

▸ see fig. enclosure rating on page F-10

F

Flat

▸ see slim on page F-8

G

GSD file (PROFIBUS)

GSD files are required for the use of PROFIBUS devices. Device data and parameters are stored in these. Users can also use them to set the desired parameters.

H

Housing material

ALG housings by SICK may be made of the following materials:

- Aluminum, anodized
- Plastic (ABS)
- Plexiglass (PMMA) – ALG front screens

In case of frequent or long-term effects of chemicals on light grids, an application test will be required.

F

I

Impact load

The impact load confirms that a test has been carried out to verify mechanical stability of the device. There are various tests here as well as the vibration resistance test.

▸ see vibration resistance on page F-9

1. Shock:

This test comprises single shocks induced on all x, y and z axes. The shock is exerted in both directions of movement for each axis.

2. Continuous shocks:

The same test is carried out here as in 1 but over a longer period of time (time is normally specified too). Continuous shocks are always performed with small accelerations e.g., just 10 g.

3. Sine-wave test:

With this test a mechanical sine-wave is induced on all axes of the device, x,y and z.

At the end of the test, no damage must be evident on the unit under test.

Initialization period

The initialization period is the time the light grid requires to be ready for operation once the supply voltage has been powered on.

J

Job LED

A job LED is a visible light designed to reliably guide the person responsible during the picking process. A job LED may be used for various functions. It can indicate both correct and incorrect intervention on the part of the picker using various colors or display durations. SICK's pick-to-light light grids are ready-equipped with integrated job LEDs.

▸ see operator guidance on page F-6

L

LED

Light emitting diodes (LEDs) are semiconductors that generate light of a certain wave length as a result of an electric simulation. The wave length is determined by the chemical composition of the semiconductor. With sender/receiver systems, LEDs in the invisible infrared wave length are primarily used as a beam source whereas, with reflection systems, LEDs in the visible red light range are used.

Light grid

A light grid enables monitoring across a wide area via a sequence of light beams.

Light grid construction

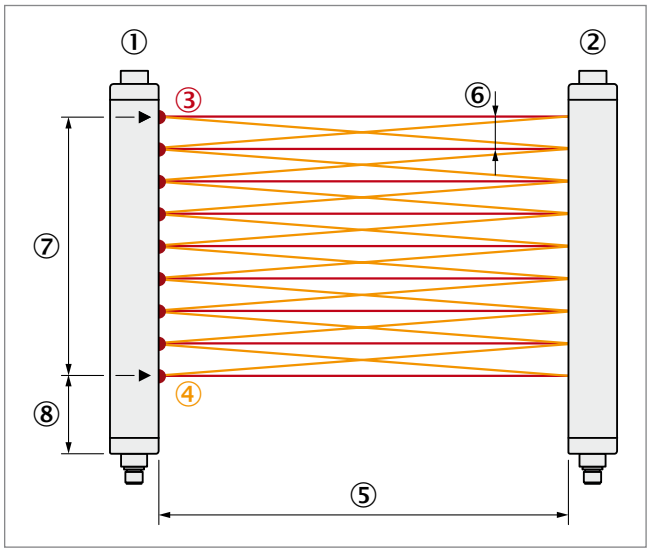

Fig. light grid construction

① Sender
② Receiver
③ Parallel beam
④ Cross beam
⑤ Range (working/limiting range)
⑥ Resolution/beam separation
⑦ Detection height
⑧ Blind zone

Light/dark switching

Sensor setting that can be used to invert the logic of the output. The terms light or dark switching are based on the point of view of the receiver element. With the "light switching" setting, the switching output (Q) is activated as soon as the receiver element receives more light than the set switching threshold. With the "dark switching" setting, the switching output (Q) is activated when the receiver element receives less light than the set switching threshold.

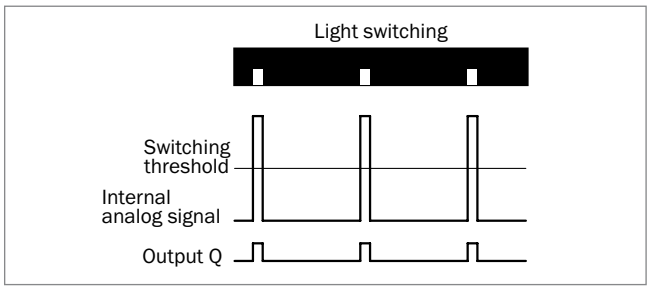

Fig. light switching

▸ see fig. dark switching on page F-6

F

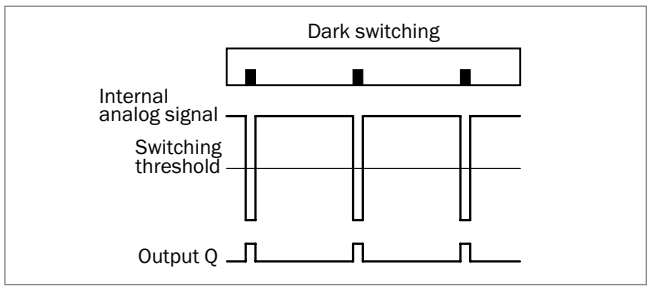

Fig. dark switching

Limiting range

The limiting range is the distance between sender and receiver or between sensor and reflector (on retro-reflective light grids) at which stable and reliable functioning can no longer be guaranteed. The limiting ranges stated constitute typical values in each case. We therefore recommend observing the recommended working range.

▸ see working range on page F-9
▸ see fig. range on page F-9

M

MDO

The MDO (Minimum Detectable Object) specifies the relevant minimum object size that must be detected at each point in the monitored area. In most cases this corresponds to the sum of the beam separation and the beam bundle diameter. Use of cross beam technology means the resolution in the ALG's central area is better than the MDO specification.

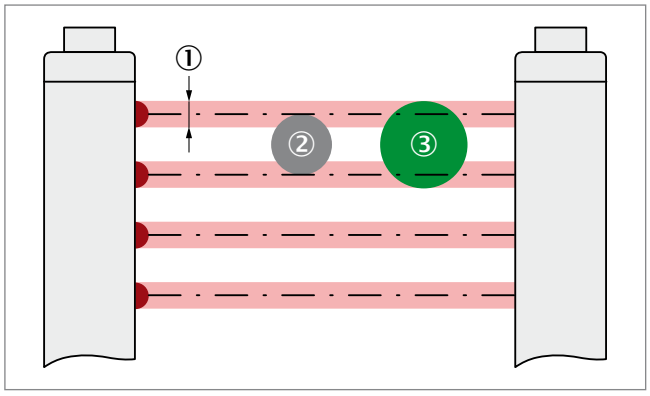

Fig. MDO

① Beam diameter
② Detection not reliable
③ MDO: Reliable detection

Measuring light grid

A measuring light grid detects the state of all individual beams. More complex tasks other than simple object presence may be carried out with a measuring light grid, such as location definition.

Minimum presence time

The minimum presence time specifies the minimum time an object needs to remain in the sensor's monitored area to be reliably detected.

▸ see fig. response time and minimum presence time on page F-8

Modular

Many ALGs have a modular construction and are therefore available in various detection heights, beam separations, interfaces and ranges.

Muting function

A muting function enables automatic blanking of a beam that has been interrupted over a long period of time e.g., due to contamination. This is an optional function with certain SICK ALGs.

N

nc

This abbreviation has the following meanings depending on its context:

- In the context of relays: normally closed
- In the context of connection diagrams: not connected.

NPN output

When the output is energized, the state of output Q changes from high-impedance to 0 V.

The output signal is therefore drawn to the negative pole of the supply voltage (ground). The load accordingly has to be connected between L+ (24 V) and the output.

O

Operator guidance

Due to the high number of assembly process variants, a multitude of manuals are required for the operator. Using SICK's pick-to-light solutions, operators are guided through the picking process safely by a light grid with a colored job LED and intervention warning so that assembly errors are reduced reliably.

▸ see job LED on page F-5

Optical synchronization

▸ see synchronization on page F-8

Output weak signal

Mist, dust, dirt, water spray, and cleaning solvents are just a few of the things that can result in deposits forming on the sensor optics or reflectors over time. This causes the level of received light to fall near the switching threshold. If the level drops below this threshold, the light grid will false trip and no longer be reliable.

F

To give the user an early warning of an impending device failure due to contamination, some SICK devices are equipped with a pre-failure signaling output known as an output weak signal. This reacts when the receiving light strength is just above the switching threshold. In case of contamination, the integrated yellow display LED will begin to flash on some light grids.

P

Parallel beam

Parallel beam technology is standard on SICK ALGs. In each case, the receiver located exactly opposite is assigned to the emitted beam. There are also ALGs that can alternatively be ordered with cross beam technology or else designs on which customers can configurate the operating mode themselves.

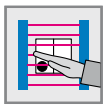
▸ see cross beam on page F-3

▸ see fig. light grid construction on page F-5

Picking

Picking is the process of choosing parts (articles) and products from an overall available range of objects (sortiment) to fulfill orders or for assembly.

Pick-to-light light grid



Pick-to-light light grids are used in the automotive industry on assembly lines but also for picking in the logistics sector to prevent incorrect assembly and erroneous selection. To simplify the assembly process, the order of the parts to be assembled is specified by a control. The relevant storage bin for object removal may be shown by a bright (green) job LED and incorrect picking by the worker by another (red) job LED for example. Pick-to-light light grids are used to make a considerable contribution to the attainment of high quality standards.

▸ see job LED on page F-5

PNP output

When the output is energized, the state of output Q changes from high-impedance to 24 V.

The output signal is therefore drawn to the positive pin of the supply voltage. The load accordingly needs to be connected between M (0 V) and the output.

Polarizing filter

Retro-reflective light grids aligned to a reflector detect the presence of objects when the light path is interrupted (i. e. the retro-reflection fails to return), thereby triggering a switching signal. Since objects to be detected may also have shiny or reflective surfaces – such as stainless steel, aluminum, or tin – the possibility of missed detection and erroneous switching as a result needs to be reliably reduced. This is achieved effectively by the use of polarizing filters.

Principle of operation

▸ see retro-reflective light grid on page F-7

▸ see sender/receiver system on page F-8

PROFIBUS

PROFIBUS (Process Field Bus) is a standard for fieldbus communication in automation technology. Specification of standards in Germany is regulated via the PNO (PROFIBUS Nutzerorganisation/user organization). Some SICK ALGs are equipped with a PROFIBUS interface.

Programmable

Programmable ALGs are available from SICK. Programming is performed via the MLG setup software. This can be downloaded from www.sick.com.

Protection class

Electrical equipment is classified in relation to existing safety measures for prevention of electric shocks. Protection classes are defined in DIN EN 61140. There are four protection classes ranging from “Basic insulation” (Class 0) to “Safety extra-low voltage (Class 1), double insulation (Class 2), safety transformer” (Class 3). All SICK ALGs have at least protection class 2.

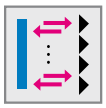
Protection class 1

Protection class 2

Protection class 3

R

Retro-reflective light grid



Retro-reflective light grids work according to the principle of retro-reflection. With these, a reflector is mounted opposite the sender and reflects the light emitted back to the sensor’s receiver element.

Relays

Relays are electrical/mechanical switches. They are used for switching electrical circuits on, off or over. Certain types of ELG Long Range by SICK are equipped with a relay output.

Reproducibility (R)

Reproducibility (R) describes the repeat accuracy of an ALG in relation to the object entering the monitored area and the resultant response time of the switching output.

F

Resolution

With light grids, resolution is determined by the beam separation. The less distance between the beams, the higher the resolution. It is important to note the MDO (Minimum Detectable Object) (▸ see MDO on page F-7) in this context.

▸ see fig. light grid construction on page F-5

Response time

Response time is the time between when an event occurs (set threshold is exceeded) and the sensor switches (switching operation). An example of an event is a package entering the area monitored by the light grid. The minimum presence time also needs to be observed in this context.

▸ see minimum presence time on page F-6

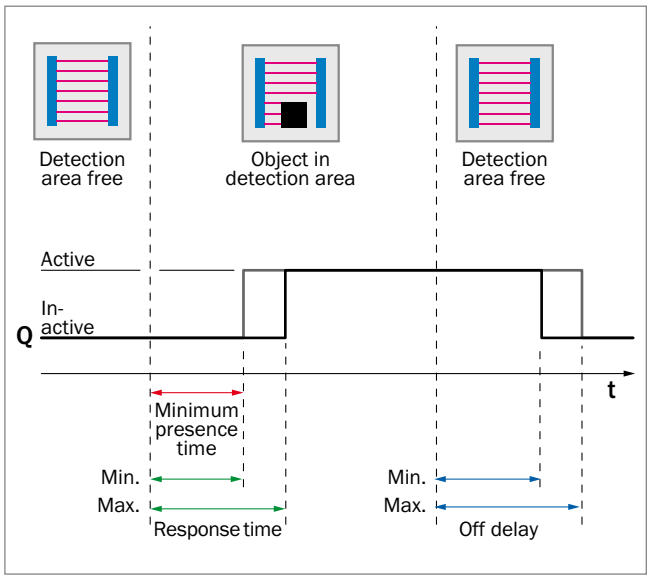


Fig. response time and minimum presence time

S

Sender/receiver system

A light grid comprises two separate devices, the sender and the receiver. This separate construction enables long ranges.

Sensitivity

Sensitivity describes the switching characteristics of the sensor with different objects or in different ambient conditions. With ALGs, sensitivity is determined by regulation of the switching threshold. This is regulated by setting a potentiometer or by means of various teach-in methods.

Slim

Smart light grids come in two designs: slim or flat. With the slim version, light emission takes place on the narrow side of the sensor while with the flat version it takes place on the flat side.

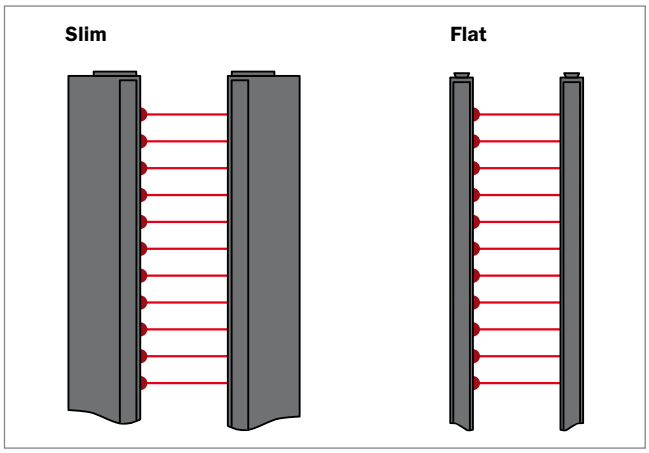

Fig. slim and flat

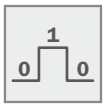
Switching light grid



A switching light grid has a simple switching function: In case at least one or more beams are interrupted, the switching output reacts and transfers the information “Monitored area interrupted”.

Switching output

A switching output is the output via which the output state of the sensor is digitally output. SICK ALGs are equipped with various types of switching outputs:

- NPN
- PNP
- Relays

Synchronization

Synchronization with ALGs is the sequential, unique allocation of each sender element to the relevant receiver element (beams). This either happens optically by one or several light beams (sync beam) or via an electrical connection by attaching a connection cable between sender and receiver. With retro-reflective light grids, synchronization is integrated in the sensor.

F

T

Teach-in

With teach-in, switching thresholds of all beams are taught in automatically and individually. The following options exist for teaching in:

- Actuation of teach-in button: SLG
- Automatic teach: SLG, MLG
  ▸ see automatic teach on page F-2
- Teach-in input: MLG, WLG, HLG, SLG
- MLG Setup: MLG Programmable, MLG Analog Output
- No teach-in required: PLG, ELG (threshold setting is via potentiometer)

The benefit of teach-in:

The switching threshold is set electronically instead of by using a potentiometer, which simplifies and speeds up commissioning of the sensor or adjustment to new applications. Particularly with light grids, this is a highly suitable method since each light beam is set individually and optimally.

Test input

The emitted light is switched off when the test input is activated, simulating a beam interruption.

Type code

In the type code, all possible light grid variants are sorted in a list according to properties. This enables users to assemble light grid properties which are suited to their requirements.

Terminals

The terminals enable cables to be guided via a sealed cable gland before being connected to the light grid. This enables use of up to six switching outputs and two inputs with ALGs.

W

Working range

The working range is the maximum recommended range between sender and receiver or between sensor and reflector (retro-reflective light grids) at which stable and reliable operation is guaranteed.

▸ see limiting range on page F-6

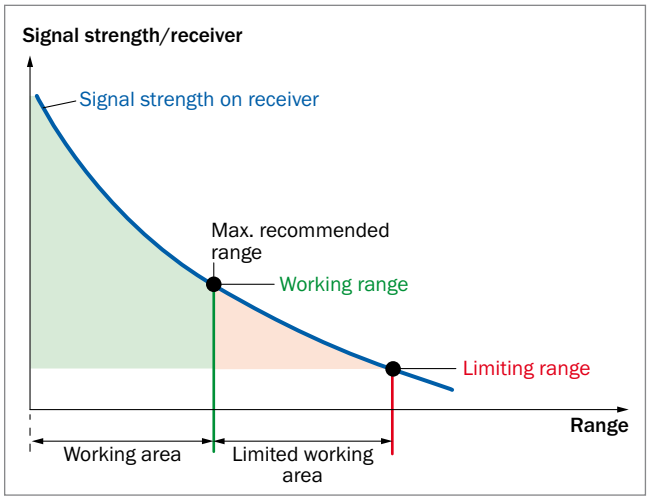


Fig. range

V

Vibration resistance

Vibration resistance is confirmed in a test according to the DIN standard.

Vibration, broadband noise: test according to DIN EN 60068-2-64:
With this test an arbitrary mechanical sine wave is induced on all axes of the device x, y and z. A random acceleration, e. g. 5 grms (statistical mean value) and a valid frequency range e. g. 10 Hz to 150 Hz are specified. The test time is likewise specified and is typically 100 min for each axis.

F

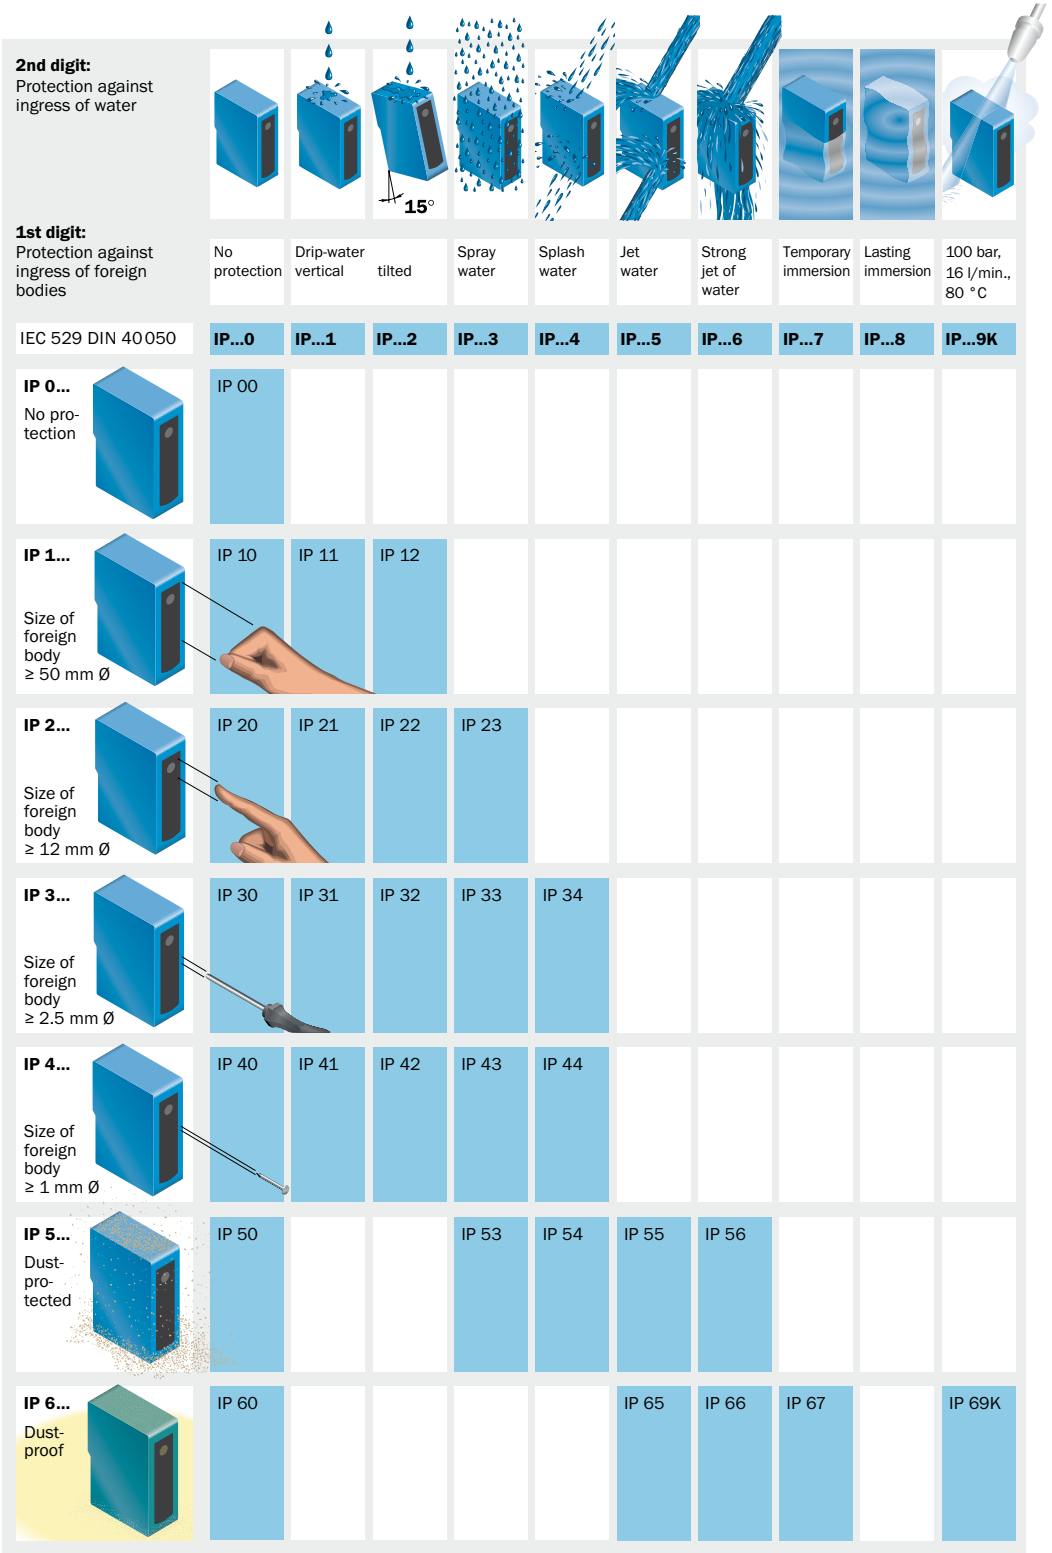

Fig. enclosure rating

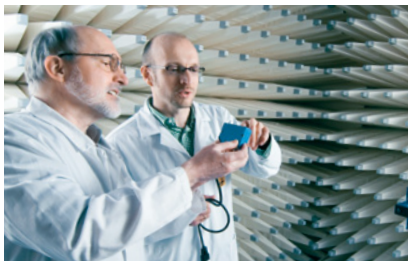
SICK at a glance



Leading technologies

With a staff of more than 5,000 and over 50 subsidiaries and representations worldwide, SICK is one of the leading and most successful manufacturers of sensor technology. The power of innovation and solution competency have made SICK the global market leader. No matter what the project and industry may be, talking with an expert from SICK will provide you with an ideal basis for your plans – there is no need to settle for anything less than the best.

Unique product range

- Non-contact detecting, counting, classifying, positioning and measuring of any type of object or media
- Accident and operator protection with sensors, safety software and services
- Automatic identification with bar code and RFID readers
- Laser measurement technology for detecting the volume, position and contour of people and objects
- Complete system solutions for analysis and flow measurement of gases and liquids

Comprehensive services

- SICK LifeTime Services – for safety and productivity
- Application centers in Europe, Asia and North America for the development of system solutions under real-world conditions
- E-Business Partner Portal www.mysick.com – price and availability of products, requests for quotation and online orders
